## PROGRESS REPORT: PEA BREEDING

The 2010 Pacific Northwest growing year started with a very wet, cool spring and advanced into a warm very dry summer. There was no significant snow fall during the 2009-2010 winter, consequently soil moisture levels were generally quite low. Overall, yields of the check varieties in the advanced yield trials were the lowest of the past five years. This reflects the lower average yields of growers throughout the Pacific Northwest in 2010. Seed size was typically larger in 2010 than in the previous five years.

## Spring Pea Yield Trials

In 2010, 18 advanced breeding lines and six check varieties of green peas were tested in the advanced yield trials. Identical trials were planted in Pullman, Fairfield and Dayton, Washington and in Kendrick and Genesee, Idaho. The Kendrick trial was lost due to extreme disease pressure (Aphanomyces root rot). The Genesee trial suffered severe deer depredation. The mean yields at the four harvested locations were: Pullman: $1706 \mathrm{~kg} / \mathrm{ha}$; Fairfield: $1778 \mathrm{~kg} / \mathrm{ha}$; Dayton: $1684 \mathrm{~kg} / \mathrm{ha}$; and Genesee: $1139 \mathrm{~kg} / \mathrm{ha}$. 2010 was the third year of advanced testing for many of the advanced lines and the first year for three of the top ten (i.e. PS07100470, PS07100471 and PS07100474). All the advanced breeding lines and four of the checks had significantly higher yields than did Columbian. Five of the advanced lines significantly out-yielded Banner and 15 out-yielded Aragorn. Yields of the advanced lines ranged from $1349-1876 \mathrm{~kg} / \mathrm{ha}$, the average yields of the check cultivars ranged from $1222 \mathrm{~kg} /$ ha (Lifter) to $1592 \mathrm{~kg} / \mathrm{ha}$ (Banner). Seed size of the check cultivars ranged from $15.6 \mathrm{~g} / 100 \mathrm{sd}$ (Ariel) to $18.8 \mathrm{~g} / 100 \mathrm{sd}$ (Aragorn). Seed size of the advanced breeding lines ranged from 15.3-20.8 g/100sd. The earliest check (Columbian) flowered in 59 days and the earliest breeding line (PS05100632) flowered at 43 days. Aragorn was the earliest check to reach harvest maturity ( 98 days), PS05100632 was the earliest maturing breeding line (97 days). PS05100632 was also the highest yielding line in the advanced yield trials.

Ten breeding lines and four check varieties were evaluated in the yellow pea advanced yield trials. Identical trials were planted in Pullman, Fairfield and Dayton, Washington and in Kendrick and Genesee, Idaho. As with the green pea trials, the Kendrick trial was lost due to extreme disease pressure (Aphanomyces root rot) and the Genesee trial suffered severe deer depredation. The mean yields at the four harvested locations were: Pullman: $1715 \mathrm{~kg} / \mathrm{ha}$; Fairfield: $2230 \mathrm{~kg} / \mathrm{ha}$; Dayton: $1728 \mathrm{~kg} / \mathrm{ha}$; and Genesee: $1203 \mathrm{~kg} / \mathrm{ha} .2010$ was the first year of advanced testing for six of the breeding lines and the fourth and fifth years for the two highest yielding entries (PS04100710 and PS03101822, respectively). Yields of the advanced lines ranged from $1545 \mathrm{~kg} / \mathrm{ha}$ to $2086 \mathrm{~kg} / \mathrm{ha}$, the average yields of the check cultivars ranged from $1568 \mathrm{~kg} / \mathrm{ha}$ (Delta) to $1942 \mathrm{~kg} / \mathrm{ha}$ (DS Admiral). Seed size of the check cultivars ranged from $17.6 \mathrm{~g} / 100 \mathrm{sd}$ (Carousel) to $19.1 \mathrm{~g} / 100 \mathrm{sd}$ (Universal). Seed size of the advanced breeding lines ranged from 17.3-21.9 g/100sd. The earliest check (Universal) and the earliest, retained breeding line (PS03101822) both flowered in 68 days. PS04100710 and PS03101522 as well as the three checks reached harvest maturity in 99 days.

The 2010 preliminary yield trials were planted in Pullman. The green trial consisted of 18 breeding lines and three checks. Four green pea breeding lines had yields significantly greater than the commercial check, Aragorn. Seed weight among the green breeding lines ranged from 13.6 to 20.3 $\mathrm{g} / 100 \mathrm{sd}$. The seed weight of the checks ranged from $17.2 \mathrm{~g} / 100 \mathrm{sd}$ (Stirling) to $19.1 \mathrm{~g} / 100 \mathrm{sd}$
(Aragorn). Stirling, the earliest check variety, flowered in 67 days; four breeding lines flowered as early as Stirling. The yellow preliminary yield trial consisted of 23 breeding lines and two checks. Three lines had yields significantly greater than the higher yielding check (Universal). Seed weight among the yellow breeding lines ranged from 17.0 to $23.1 \mathrm{~g} / 100 \mathrm{sd}$. The seed weight of the check varieties was $19.2 \mathrm{~g} / 100 \mathrm{sd}$ (Delta) and $19.1 \mathrm{~g} / 100 \mathrm{sd}$ (Universal). Universal was the first check to flower (68 days), five breeding lines flowered at or before Universal.

The breeding lines were evaluated for resistance to Pea Enation Mosaic Virus in Corvallis, Oregon, for resistance to Fusarium wilt, Race 1 in Pullman, Washington and for tolerance to Aphanomyces root rot intentionally in Athena, Oregon and in LeSueur, Minnesota and unintentionally in Kendrick, Idaho. Breeding lines and segregating families were also screened in pure culture in the greenhouse for tolerance to Aphanomyces root rot. Within the segregating families ( $\mathrm{F}_{4}$ to $\mathrm{F}_{6}$ families), tolerant individuals were selected and transplanted for crossing and generation advance.

Potential product quality of the green pea breeding lines was assessed visually. All entries in the green pea advanced and preliminary yield trials were subjected to a simulated high temperature, high humidity bleach test.

## Potential Spring Pea Variety Releases

PS0310445 was identified in 2008 as a potential variety release. It is a semi-leafless spring green breeding line that has been tested in 15 location/years of yield trials. The data in Table 1 provide comparisons of the performance of PS0310445 with Columbian, Aragorn and Banner.

Table 1. Comparison of the performance of PS0310445 with three commercial varieties in 15 location/years.

| Banner | $\mathrm{S} ?$ | S | S | af | 56 | 74 | 75 | 53 | 17.7 | 1945 |

PS05100840 was identified in 2009 as a potential new spring pea variety release. It is semi-leafless and has green cotyledons. It has been evaluated in 12 location/years. Pre-breeder seed was made in 2010. The data in Table 2 provide comparisons of the performance of PS05100840 with Columbian, Aragorn and Banner.

Table 2. Comparison of the performance of PS005100840 with three commercial varieties in 12 location/years.

| Banner | $\mathrm{S} ?$ | S | S | af | 57 | 71 | 73 | 53 | 17.6 | 1850 |

PS03101822 was identified in 2008 as a potential variety release. It is a semi-leafless spring yellow pea breeding line. It has been evaluated in 19 location/years of yield trials. The data in Table 3 provide comparisons of the performance of PS03101822 with Carousel, Universal, DS Admiral and Delta.

Table 3. Comparison of the performance of PS03101822 with four commercial varieties in 19 location/years.

| Delta | R | R | S | af | 57 | 87 | 59 | 54 | 20.2 | 1861 |

PS04100710 was identified in 2010 as a potential variety release it is a semi-leafless, yellow cotyledon spring pea. It has been evaluated in 16 location/years of yield trials. We anticipate making pre-breeder seed of it in 2011.

Pre-breeder seed of PS03101445 and PS05100840 was made in summer 2010. It was sent to New Zealand for increase in 2010-2011. Seed will return in March 2011, in time for spring planting and seed increase. We anticipate releasing these two varieties in 2011. Pre-breeder seed of several other varieties in both the green and yellow trials displayed exceptional performance and potential; however, they have been in trials for only 1-2 years and must be evaluated across more location/years.

## Winter Pea Yield Trials

Winter pea advanced yield trials were planted at Garfield, Rosalia and Pullman, Washington. All trials were identical and consisted of 14 advanced breeding lines and three checks. Rosalia was lost to cultivator-driver error, Garfield was lost to winter-kill. Only Pullman was harvested. There were large differences in the dates of maturity of the lines. In previous years, the planting scheme did not allow 'just-in-time' harvesting - all plots were harvested on the same day. Therefore, many of the
early maturing lines shattered and the yields recorded are not reflective of what would have been realized if harvest was timely. In 2009-2010, the early maturing lines were planted in a block with their check, Whistler, and the 'full-season' lines were planted in an adjacent block with their checks, Windham and Specter. None of the early maturing entries survived the winter with appreciable stand counts and were not harvested. Yields of the retained full-season breeding lines ranged from 1079 $2706 \mathrm{~kg} / \mathrm{ha}$. Yields of the checks were Windham: $2730 \mathrm{~kg} / \mathrm{ha}$ and Specter: $2004 \mathrm{~kg} / \mathrm{ha}$. Windham was the highest yielding entry in the trial; however, three experimental lines had statistically equivalent yields.

## Potential Winter Pea Variety Releases

PS03101269 has consistently performed well in the Palouse yield trials. Although it is a strong performer in the Palouse, it has not performed particularly well on the Waterville Plateau. It will not be recommended for that area. PS03101239 has long internodes, is semi-leafless and has green, food quality seeds. Data collected over five years are presented in Table 4. Issues with winter kill and cultivator operator error have resulted in limited location/year data. Breeder's seed was be made in 2010 and is being increased in New Zealand 2010-2011. We anticipate transferring breeder seed to the Washington Crop Improvement Association in March 2011.

Table 4. Performance of winter pea PS03101269 (2007-2010).

| Entry | FW <br> R1 | PM | PEMV | Leaf | Coty <br> Color | SdWt <br> $(\mathbf{g} / \mathbf{1 0 0 s d})$ | Yield <br> $(\mathbf{k g / h a})$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Windham | R | R | S | af | Yellow | 14.9 | 2068 |
| Specter | R | R | S | af | Yellow | 13.7 | 1394 |
| Whistler | R | R | S | af | Yellow | 16.5 | 1574 |

PS03101146, PS05300234 and PS05300180 continue to perform very well in Wilbur and on the Waterville Plateau (in trials conducted by the Central Washington Grain Growers) but with limited enthusiasm on the Palouse. We made pre-breeder's seed of these three lines in anticipation of releasing them as varieties with adaptation to a specific area. Characteristics of these three lines are presented in Table 5 (yield data kindly provided by Howard Nelson, (CWGG, Wilbur, Washington).

Table 5. Characteristics of winter pea varieties adapted to Wilbur, Washington.

| Whistler | R | R | S | af | Yellow | 16.2 | 2423 |

## OTHER PROGRESS TO REPORT

## Mineral Nutrition

A preliminary survey of the diversity of the mineral nutrients in peas was conducted from the 2009 harvest. Seed samples harvested from each entry in the 2009 green and yellow advanced yield trials were analyzed for mineral concentration using inductively-coupled plasma atomic-emission spectroscopy. Concentrations of the macro-nutrients $\mathrm{Ca}, \mathrm{K}, \mathrm{P}, \mathrm{Mg}$ and S and the micro-nutrients Co, $\mathrm{Cu}, \mathrm{Fe}, \mathrm{Mn}, \mathrm{Se}$ and Zn were determined. Some summary statistics are presented below.

There are location differences in the levels of all macro minerals tested. Seeds from Kendrick consistently had lower levels of minerals than did seeds harvested from either Fairfield or Genesse (Table 6.).

Table 6. Means of macro-mineral concentrations in seeds of pea genotypes grown at three locations 2009. Means followed by different letters are significantly different ( $\mathrm{p}<.01$ )

|  | Ca (mg/g <br> DW) <br> Mean(se) | K (mg/g <br> DW) <br> Mean (se) | Mg (mg/g DW) <br> Mean (se) | P (mg/g DW) <br> Mean (se) | S (mg/g DW) <br> Mean (se) |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Fairfield | $1.00(0.04) \mathrm{a}$ | $9.24(0.08) \mathrm{a}$ | $1.28(0.01) \mathrm{a}$ | $3.57(0.05) \mathrm{a}$ | $1.77(0.03) \mathrm{a}$ |
| Genesee | $0.92(0.04) \mathrm{ab}$ | $9.36(0.08) \mathrm{a}$ | $1.25(0.02) \mathrm{a}$ | $3.11(0.04) \mathrm{b}$ | $1.70(0.03) \mathrm{ab}$ |
| Kendrick | $0.86(0.03) \mathrm{b}$ | $8.92(0.09) \mathrm{b}$ | $1.12(0.01) \mathrm{b}$ | $2.42(0.04) \mathrm{c}$ | $1.65(0.03) \mathrm{b}$ |

There were differences in the levels of the micro-minerals $\mathrm{Mn}, \mathrm{Se}$ and Zn at the three locations. Kendrick had the lowest levels of Mn and Se , but the highest levels of Zn (Table 7.)

Table 7. Means of micro-mineral concentrations in seeds of peas grown at three locations in 2009. Means followed by different letters are significantly different ( $\mathrm{p}<.01$ )

|  | Co (ug/g DW) <br> Mean(se) | Cu (ug/g DW) <br> Mean (se) | Fe (ug/g DW) <br> Mean (se) | Mn (ug/g DW) <br> Mean (se) | Se (ug/g DW) <br> Mean (se) | Zn (ug/g DW) <br> Mean (se) |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Fairfield | $0.04(0.11) \mathrm{a}$ | $6.34(0.09) \mathrm{a}$ | $50.34(0.76) \mathrm{a}$ | $11.85(0.19) \mathrm{b}$ | $0.25(0.01) \mathrm{a}$ | $34.68(0.54) \mathrm{b}$ |
| Genesee | $0.04(0.14) \mathrm{a}$ | $6.19(0.10) \mathrm{a}$ | $53.64(0.98) \mathrm{a}$ | $13.89(0.29) \mathrm{a}$ | $0.33(0.02) \mathrm{b}$ | $33.23(0.49) \mathrm{b}$ |
| Kendrick | $0.03(0.11) \mathrm{a}$ | $6.05(0.09) \mathrm{a}$ | $52.48(1.03) \mathrm{a}$ | $9.30(0.15) \mathrm{c}$ | $0.43(0.02) \mathrm{c}$ | $41.65(1.04) \mathrm{a}$ |

Market class of pea (green vs yellow) did not account for significant differences in levels of $\mathrm{Ca}, \mathrm{P}$ or S, but green peas had significantly higher levels of K and Mg than did yellow peas (Table 8.).

Table 8. Means of macro-mineral concentrations in seeds offspring green vs spring yellow pea genotypes in 2009. Means followed by different letters are significantly different ( $\mathrm{p}<.01$ )

|  | Ca (mg/g DW) <br> Mean(se) | K (mg/g DW) <br> Mean (se) | Mg (mg/g DW) <br> Mean (se) | P(mg/g DW) <br> Mean (se) | S (mg/g DW) <br> Mean (se) |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Green | $0.97(0.03) \mathrm{a}$ | $9.29(0.06) \mathrm{a}$ | $1.25(0.01) \mathrm{a}$ | $3.11(0.07) \mathrm{a}$ | $1.72(0.02) \mathrm{a}$ |
| Yellow | $0.87(0.77) \mathrm{a}$ | $9.01(0.08) \mathrm{b}$ | $1.16(0.01) \mathrm{b}$ | $2.91(0.06) \mathrm{a}$ | $1.70(0.02) \mathrm{a}$ |

There were no significant differences in the levels of $\mathrm{Fe}, \mathrm{Mn}, \mathrm{Se}$ or Zn in green vs yellow peas. Yellow peas had higher levels of Co and green peas had higher levels of Cu (Table 9.)

Table 9. Means of micro-mineral concentrations in seeds offspring green vs spring yellow pea genotypes in 2009. Means followed by different letters are significantly different ( $\mathrm{p}<.01$ )

|  | Co (ug/g DW) <br> Mean(se) | Cu (ug/g DW) <br> Mean (se) | Fe (ug/g DW) <br> Mean (se) | Mn (ug/g DW) <br> Mean (se) | Se (ug/g DW) <br> Mean (se) | Zn (ug/g DW) <br> Mean (se) |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Green | $0.09(0.003) \mathrm{b}$ | $6.33(0.08) \mathrm{a}$ | $51.68(0.73) \mathrm{a}$ | $11.66(0.24) \mathrm{a}$ | $0.29(0.01) \mathrm{a}$ | $37.39(0.08) \mathrm{a}$ |
| Yellow | $0.15(0.007 \mathrm{a}$ | $6.00(0.07) \mathrm{b}$ | $52.86(0.81) \mathrm{a}$ | $11.71(0.37) \mathrm{a}$ | $0.34(0.02) \mathrm{a}$ | $35.31(0.06) \mathrm{a}$ |

The analyses will be repeated with seed harvested from each plot/location of each variety in the 2010 advanced yield trials. This will allow us to determine the relative importance variation due to the genotype, the environment and the genotype-by-environment interaction. Knowing this information will allow us to develop practical approaches to breed successfully for increased mineral nutrient concentrations.

Leaf Type: + = normal leaf; - = afila or semi-leafless. Vine Type: + = tall vine; - = short vine.
FW1 = Fusarium Wilt Race 1; R = resistant; S = susceptible. PM = Powdery Mildew, R = resistant; S = susceptible. PEMN = Pea Enation Mosiac Virus; R = resistant; S = susceptible. Pod height was measured at the green pod stage and at harvest maturity. Pod height index = pod height at harvest maturity divided by the pod height at the green pod stage.
Plant height was measured at the green pod stage and at harvest maturity. Plant height index $=$ plant height at harvest maturity divided by the green plant height at the green pod stage. 19
Repr Nodes $=$ average number of reproductive nodes on a plant.
Agronomic data are means of three replications at Pullman, WA. Planting Date 04/20/10 Harvest Date: 08/11/10

Leaf Type: + = normal leaf; - = afila or semi-leafless. Vine Type: + = tall vine; - = short vine.
FW1 = Fusarium Wilt Race 1; R = resistant; S = susceptible. PM = Powdery Mildew, R = resistant; S = susceptible. PEMN = Pea Enation Mosiac Virus; R=resistant; S=susceptible.
Pod height was measured at the green pod stage and at harvest maturity. Pod height index $=$ pod height at harvest maturity divided by the pod height at the green pod stage.
Plant height was measured at the green pod stage and at harvest maturity. Plant height index = plant height at harvest maturity divided by the green plant height at the green pod stage. 22 Repr Nodes = average number of reproductive nodes on a plant.

## PROGRESS REPORT: LENTIL BREEDING

## Lentil Yield Trials

Advanced lentil yield trials were planted at three locations in 2010: Pullman, WA; Fairfield, WA, and Kendrick, ID. Each location had individual yield trials for advanced breeding lines representing the lentil market classes: Large- Seeded Yellow cotyledons, Turkish Red, Eston, Spanish Brown (Pardina), and Zero-Tannin. The entire Kendrick trial was abandoned due to extensive and severe Aphanomyces root.

Twenty nine entries and four check varieties (Brewer, Merrit, Richlea and Riveland) were included in the advanced large-seeded, yellow cotyledon lentil yield trial in 2010. The mean yield at Pullman was $800 \mathrm{~kg} / \mathrm{ha}$ and the mean yield at Fairfield was $2420 \mathrm{~kg} / \mathrm{ha}$. The breeding line LC01602300R, did not perform as well as in the three previous years. Eight breeding lines and three checks had higher average yields. The highest yielding check was Merrit ( $1757 \mathrm{~kg} / \mathrm{ha}$ ) while the lowest was Brewer ( $1586 \mathrm{~kg} / \mathrm{ha}$ ). Sixteen breeding lines had greater yields than Brewer and five had yields greater than Merrit. The largest seed weight among checks was observed for Riveland ( $6.8 \mathrm{~g} / 100$ seeds) and the smallest was Richlea ( $5.3 \mathrm{~g} / 100$ seeds). Fifteen breeding lines had seed weights that were statistically equivalent to Riveland ( $6.3-7.2 \mathrm{~g} / 100 \mathrm{sd}$ ), four lines had seed weights that were greater than Riveland (>7.2g/100sd). Several advanced breeding lines also exhibited superior lodging tolerance and plant height when compared to the commercial check varieties. Preliminary breeding lines ( $\mathrm{N}=17$ ) of large seeded, yellow cotyledon lentils were also evaluated in 2010 at Pullman, WA. Several preliminary lines were identified that will be promoted into advanced yield trials conducted in 2011 based on superior yield, seed quality, and lodging tolerance. Breeding objectives for this broad class of lentils include improving seed color and seed shape while increasing yields and seed size.

Advanced yield trials for the Turkish Red market class included 11 advanced breeding lines and the check variety 'Crimson'. The mean yield at Pullman was $891 \mathrm{~kg} / \mathrm{ha}$ and the mean yield at Fairfield was $1340 \mathrm{~kg} / \mathrm{ha}$. The grand mean over both locations was $1116 \mathrm{~kg} / \mathrm{ha}$. When averaged over all three locations, three advanced breeding lines yielded higher than Crimson ( $1165 \mathrm{~kg} / \mathrm{ka}$ ). One advanced breeding line, LC01602062T, had higher yields ( $929 \mathrm{~kg} / \mathrm{ha}$ (Pullman) and 1696 $\mathrm{kg} / \mathrm{ha}$ (Fairfield)) than Crimson ( $777 \mathrm{~kg} / \mathrm{ha}$ (Pullman) and $1653 \mathrm{~kg} / \mathrm{ha}$ (Fairfield)) at both locations. This breeding line has a larger, more spherical seed than the check Crimson, and represents the seed shape that characterizes the 'Turkish Red' lentil class. All 11 advanced breeding lines had significantly larger seed size (100 seed weight) than Crimson. Data collected on the advanced breeding lines indicate that progress has been made in improving yield and seed size. Breeding efforts will continue to improve other important traits, including height and tolerance to lodging, and introgress these desirable traits into lines with excellent seed quality and high yields.

Six Eston type advanced breeding lines were compared to the check variety Eston and the new variety Essex (tested as LC01602307E) in 2010. The mean yield at Pullman was $808 \mathrm{~kg} / \mathrm{ha}$ and the mean yield at Fairfield was $2207 \mathrm{~kg} / \mathrm{ha}$. The grand mean over both locations was $1508 \mathrm{~kg} / \mathrm{ha}$. Four advanced breeding lines (LC08600039E, LC08600005E, LC01602273E, and LC05600812E) had yields that were greater than Eston at all three locations. Breeding line

LC005600812E had the highest yield ( $1811 \mathrm{~kg} / \mathrm{ha}$ ) of all entries. The three highest yielding advanced breeding lines (LC005600812E, LC01602273E and LC08600005E) had average yields that were $34 \%, 24 \%$, and $20 \%$ greater than that of Eston. These three breeding lines had seed weights that were slightly larger that Eston ( $3.3 \mathrm{~g} / 100$ seeds). These three breeding lines also were similar to Eston with respect to lodging tolerance, plant height, and maturity. Data collected on the nine advanced breeding lines indicate that excellent progress is being made on developing breeding lines that greatly exceed the yield of Eston while maintaining desirable seed size and agronomic characters required for this market class.

Eleven Spanish Brown advanced breeding lines were compared to the check variety Pardina in 2010. The mean yield at Pullman was $634 \mathrm{~kg} / \mathrm{ha}$ and the mean yield at Fairfield was $2135 \mathrm{~kg} / \mathrm{ha}$. The grand mean over both locations was $1400 \mathrm{~kg} / \mathrm{ha}$. Seven advanced breeding lines (LC08600113P, LC08600114P, LC08600109P and LC08600116P, LC02601144P, LC08600115P and LC06600907P) had yields that were greater than Pardina ( $1400 \mathrm{~kg} / \mathrm{ha}$ ). Plant Height Index, an indicator of lodging tolerance, and canopy height, another indicator of ease of harvesting, were both equivalent to Pardina in six of the lines. LC08600116P has a plant height index that is statistically better than Pardina. The seed weights of the three highest yielding entries tended to be slightly greater that of Pardina. Data collected from the 11advanced breeding lines indicates that progress is being made in improving yield, height, and lodging tolerance in Spanish Brown breeding lines. LC02601144P is being released and has been named 'Morena'.

Six Zero-Tannin advanced breeding lines were compared to the yellow-seeded Zero-Tannin check Shasta and the red-seeded Zero-Tannin check Cedar in 2010. The mean yield at Pullman was $761 \mathrm{~kg} / \mathrm{ha}$ and the mean yield at Fairfield was $1265 \mathrm{~kg} / \mathrm{ha}$. The grand mean over both locations was $1013 \mathrm{~kg} / \mathrm{ha}$. Cedar was the highest yielding ( $1564 \mathrm{~kg} / \mathrm{ha}$ ) entry at Fairfield and LC06600939YZ was the highest yielding ( $919 \mathrm{~kg} / \mathrm{ha}$ ) entry at Pullman. The advanced breeding line LC06600939YZ, had the best plant height index (tolerance to lodging) and pod height index (high pods at harvest). As in 2009, the second highest yielding breeding line was the red cotyledon line LC99602585RZ. Results suggest gains are being made in developing high yielding Zero-Tannin lentils with both yellow and red cotyledons.

## Variety Release

Morena is a high yielding Pardina type lentil. Over thirteen location-years of advanced yield trials Morena has averaged $1348 \mathrm{~kg} / \mathrm{ha}$, a $13.1 \%$ increase over Pardina during the same trials ( $1192 \mathrm{~kg} / \mathrm{ha}$ ). The seed size of Morena is very similar to that of Pardina ( $\approx 3.8 \mathrm{~g} / 100$ seed). Besides high yield and good seed characteristics, Morena is considerably taller than Pardina and has better tolerance to lodging (Table 1). Foundation seed of 'Morena' was produced in 2010. Plant Variety Protection has been applied for. Morena will be distributed through a licensing agreement with the Washington State Crop Improvement Association. Please contact Ron Whittum (509.335.8250) for more information.

Table 1. Comparison of Morena (LC02601144P) and Pardina based on 13 location-years of data from advanced yield trials conducted in Washington and Idaho (2005-2009).

| Line | Canopy Height <br> $(\mathrm{cm})$ | Days to <br> Maturity | Plant Height <br> Index $^{\mathrm{a}}$ | Seed Weight <br> $(\mathrm{gm} / 100$ <br> seeds $)$ | Yield (kg/ha) |
| :--- | :---: | :---: | :---: | :---: | :---: |
| LC02601144P | 33 | 93.8 | 0.85 | 3.8 | 1348 |
| Pardina | 25.4 | 92.4 | 0.79 | 3.9 | 1192 |

${ }^{\text {a }}$ Plant Height Index $=$ Plant Height mature green stage/Plant Height harvest stage.

## Potential Variety Releases

LC01602062T is a large seeded Turkish Red type lentil that averaged $1146 \mathrm{~kg} / \mathrm{ha}$ over 12 location-years of evaluation in advanced yield trials, which represents a $17.9 \%$ increase in yield over the cultivar Crimson ( $972 \mathrm{~kg} / \mathrm{ha}$ ) over the same trials. LC01602062T has a much larger seed than Crimson (Table 2), which makes it much more amenable to splitting. In 2010 the line will be proposed for release and breeder seed will be produced.

Table 2. Comparison of LC01602062T and Crimson based on 12 location-years of data from advanced yield trials conducted in Washington and Idaho (2005-2009).

| Line | Canopy Height <br> $(\mathrm{cm})$ | Days to <br> Maturity | Plant Height <br> Index $^{\mathrm{a}}$ | Seed Weight <br> $(\mathrm{gm} / 100$ <br> seeds $)$ | Yield (kg/ha) |
| :--- | :---: | :---: | :---: | :---: | :---: |
| LC01602062T | 30.5 | 94 | 0.90 | 4.6 | 1146 |
| Crimson | 28.1 | 92.6 | 0.88 | 3.3 | 972 |

${ }^{\text {a }}$ Plant Height Index $=$ Plant Height mature green stage/Plant Height harvest stage.

For two consecutive years (2008-2009) LC01602300R has placed first in the large seeded green lentil advanced yield trials. LC01602300R has a seed that is similar in size to Richlea ( $\approx 5 \mathrm{~g} / 100$ seeds) and has yielded an average of $1174 \mathrm{~kg} / \mathrm{ha}$ over 10 location-years of advanced yield trials (Table 3). This represents a yield increase of $10.3 \%$ over Richlea. In 2010 LC01602300R will be proposed for release and breeder seed will be produced.

Table 3. Comparison of LC01602300R and Richlea based on 10 location-years of data from advanced yield trials conducted in Washington and Idaho (2005-2009).

| Line | Canopy Height <br> $(\mathrm{cm})$ | Days to <br> Maturity | Plant Height <br> Index $^{\mathrm{a}}$ | Seed Weight <br> $(\mathrm{gm} / 100$ <br> seeds $)$ | Yield (kg/ha) |

| LC01602300R | 34.4 | 97.5 | 0.95 | 4.9 | 1174 |
| Richlea | 33.4 | 96.5 | 0.91 | 5.2 | 1064 |

${ }^{\text {a }}$ Plant Height Index $=$ Plant Height mature green stage/Plant Height harvest stage.

## Winter Lentil Yield Trials

Advanced yield trials for fall sown winter-hardy Turkish Red lentils, which included 12 advanced breeding lines and the variety Morton, were planted in three locations in WA: Pullman, Rosalia, and Garfield. Reliable yield data was only obtained from the Pullman location. Yields were high at this location, averaging $2350 \mathrm{~kg} / \mathrm{ha}$. The highest yield among entries was 3194 $\mathrm{kg} / \mathrm{ha}$, for the advanced breeding line LC05600512T, a small seeded red lentil. The second and third highest yields were $3090 \mathrm{~kg} / \mathrm{ha}$ and $2905 \mathrm{~kg} / \mathrm{ha}$, observed for breeding line LC03600232T and the cultivar Morton, respectively. The most promising entry among winter hardy lentil breeding lines is LC03600232T, which has been observed over 10 site/years of advanced yield trials to average $1319 \mathrm{~kg} / \mathrm{ha}$, which is approximately $91 \%$ the yield of Morton ( $1436 \mathrm{~kg} / \mathrm{ha}$ ). LC03600232T has an oval shape that is characteristic of Turkish Red lentils and a mean seed size of $3.6 \mathrm{~g} / 100$ seeds, which is considerably larger than the seed size of Morton ( $3.2 \mathrm{~g} / 100$ seeds), which has a flatter seed shape. These seed characters may make LC03600232T an acceptable lentil for decorticating and polishing prior to marketing.

## OTHER PROGRESS TO REPORT

## Mineral Nutrition

A preliminary survey of the diversity of the mineral nutrients in lentils was conducted from the 2009 harvest. Seed samples harvested from each entry in the Kendrick and Fairfield 2009
Turkish Red, Eston, Pardina, Large-Seeded Yellow and Winter lentil advanced yield trials were analyzed for mineral concentration using inductively-coupled plasma atomic-emission spectroscopy. Concentrations of the macro-nutrients $\mathrm{Ca}, \mathrm{K}, \mathrm{P}, \mathrm{Mg}$ and S and the micro-nutrients $\mathrm{Co}, \mathrm{Cu}, \mathrm{Fe}, \mathrm{Mn}, \mathrm{Se}$ and Zn were determined. There was significant variation among the entries and among the locations for the minerals evaluated. An additional year of analysis will allow partitioning the sources of variance into that due to genotype, to environment and the genotype-by-environment interaction. Some summary statistics are presented below. Summary statistics for each entry are available.

There were significant differences between the market classes for levels of the macro-nutrient minerals. Typically, winter lentils had among the highest levels of the macro-nutrient minerals, except for P. (Table 4.)

Table 4. Concentration of the macro-nutrient minerals by market class (means followed by different letters are significantly different, $\mathrm{p}<.01$ )

| Market Class | Ca <br> (mg/g DW) |  |
| :--- | ---: | :--- |

There were significant differences between locations for most of the mineral nutrients. There were no significant differences in Calcium, Manganese or Selenium concentration between the two locations. For Copper, Potassium, Magnesium, Nickel, Phosphorus and Sulfur concentrations were higher at Fairfield and only Zinc and Iron were higher at Kendrick (Tables 6 and 7).

Table 6. Effect of location on micro-nutrient mineral content in Lentils (means followed by different letters are significantly different: $\mathrm{p}<.01$ ).

Pod height was measured at the green pod stage and at harvest maturity. Pod height index = pod height at harvest maturity divided by the pod height at the green pod stage.
Plant height was measured at the green pod stage and at harvest maturity. Plant height index = plant height at harvest maturity divided by the green plant height at the green pod stage.
Agronomic data are means of three replications at Pullman, WA
Check Variety Merrit

## PROGRESS REPORT: CHICKPEA BREEDING

Twenty advanced breeding lines and four check varieties (Sierra, Dwelley, Dylan, and Sawyer) were included in the advanced large Kabuli chickpea yield trials conducted at Genesee, ID, Kendrick, ID and Pullman, WA in 2010. Mean yield of the trial at Spillman Farm (Pullman) was $923 \mathrm{~kg} / \mathrm{ha}, 1008 \mathrm{~kg} / \mathrm{ha}$ at Genesee, and $1531 \mathrm{~kg} / \mathrm{ha}$ at Kendrick. The highest yielding check, Sawyer, averaged $909 \mathrm{~kg} / \mathrm{ha}$ over three locations while the lowest yielding check was Sierra (768 $\mathrm{kg} / \mathrm{ha})$. Fourteen advanced breeding lines had mean yields greater than Sierra. The five best performing lines had yields that averaged $23 \%$ higher than Sierra. These lines ranged in seed size from relatively small ( $41 \mathrm{~g} / 100$ seed) to quite large ( $52 \mathrm{~g} / 100$ seed) and expressed moderate maturity rates (112-115 d).

The 2010 Preliminary Chickpea Yield Trial conducted at Pullman, WA included 29 kabuli lines, 14 Spanish White lines, 2 Desi lines and four commercial check cultivars (Sierra, Dwelley, Dylan and Sawyer). Among the check cultivars, the highest yields were observed for Sawyer ( $969 \mathrm{~kg} / \mathrm{ha}$ ) and Sierra ( $966 \mathrm{~kg} / \mathrm{ha}$ ), while Dylan had the lowest yield ( $705 \mathrm{~kg} / \mathrm{ha}$ ). The five best performing preliminary lines had yields that averaged $32 \%$ higher than Dwelley. Six breeding lines, including a Spanish White line, had yields greater than Sierra ( $966 \mathrm{~kg} / \mathrm{ha}$ ). These lines ranged from moderate ( $46 \mathrm{~g} / 100$ seed) to large ( $54 \mathrm{~g} / 100$ seed) seed size and tended to mature 12 d later than Sawyer or Sierra. Five Spanish White lines had yields that were greater than Dwelley. These five lines had yields that averaged 29\% higher than the Spanish White cultivar Dylan. The top three Spanish White lines averaged 36\% higher yields than Dylan.

A constant challenge of the breeding program is to correctly anticipate future market needs when developing breeding strategies for future variety development. In 2010 crosses were made among elite breeding lines with primary focus being given to high yield, large seed size, and light cafe or white seed color. In 2010 it is possible that a new disease of chickpea was also introduced to the Pacific Northwest. Both simple leaf and compound leaf type cultivars appeared to be susceptible. The disease was characterized by leaf browning and necrosis that initiated at the leaf tip and proceeded down the leaf. Root systems of affected plants exhibited excellent health. Extensive sampling of plants from affected fields was conducted and plants were examined for the presence of fungi or viruses. No fungi could be isolated from infected leaf tissue despite several attempts using a range of methods including PCR, tissue staining, microscopy and microbiology. The symptoms could not be reproduced by mechanical inoculation of plants with extracts of brown/necrotic leaves.

Samples were also sent to commercial laboratories to detect viruses. Leaf tissue expressing characteristic symptoms were screened for a panel of different viruses known to infect legumes. Positive detection of viruses by ELISA was very rarely observed, despite all of the sampled tissue expressing similar symptoms. These observations indicate that the cause of this apparent disease in chickpea has not been clearly determined at the present. Visual observations suggest that both preliminary and advanced chickpea breeding lines and cultivars exhibit some differences among lines for expression of the leaf necrosis typical of this malady. Special attention will be paid to chickpea yield trials and production fields in 2011 so that any emergence of the typical leaf necrosis is rapidly detected. Examination of affected plants will continue to determine the etiology of observed symptoms.

Breeder seed was produced in 2010 of CA0469C025C and CA04900421C. These lines are early maturing high yielding advanced breeding lines with enhanced levels of resistance to Ascochyta blight (Table 1). CA0469C025C, a small café Kabuli type, was approved for release as a new germplasm in 2010. This germplasm can serve as a source of genes for incorporating high yield, early maturity, and blight resistance into improved large Kabuli varieties.

## Potential Chickpea Variety Releases

CA046900421C is a high yielding, fairly large size café Kabuli chickpea that could possibly serve as a replacement for Dwelley or Sierra. Over 4 years of evaluation, CA04900421C has outielded Dwelley and Sierra by $9 \%$ and $6 \%$, respectively (Table 1). CA04900421C has similar maturity as Dwelley and Sierra and is more resistant to Ascochyta blight than Dwelley. CA04900421C has a seed size that is $95 \%$ that of Dwelley or Sierra. This breeding line will be examined in advanced yield trials in 2011 and will also be entered into yield trials conducted by collaborators in the Pacific Northwest and Northern Plains to gain an additional year of data prior to its final consideration for release as a new café Kabuli variety.

${ }^{\mathrm{b}}$ Scored using a 1 (healthy) to 9 (dead plant) disease severity index.

## OTHER PROGRESS TO REPORT

## Mineral Nutrition

A preliminary survey of mineral nutrient contents was conducted on samples from the advanced chickpea breeding lines harvested in 2009 at Genesee and Kendrick, ID. Samples were examined for amounts of macronutrients $\mathrm{Ca}, \mathrm{K}, \mathrm{P}, \mathrm{Mg}$, and S and micronutrient minerals $\mathrm{Co}, \mathrm{Cu}$, $\mathrm{Fe}, \mathrm{Mn}, \mathrm{Se}$ and Zn . Chickpeas harvested at Kendrick had significantly higher levels of $\mathrm{Cu}, \mathrm{Fe}, \mathrm{Se}$ and Zn (Table 1A), while samples grown at Genesee has significantly higher levels of $\mathrm{Ca}, \mathrm{Co}$, Mn , and Ni (Table 1B). Not differences were observed between locations for the amount of K , $\mathrm{Mg}, \mathrm{P}$, and S detected in chickpea seed. A much more extensive analysis will be conducted on samples harvested during 2010. This analysis will provide the first indications as to the relative contributions of environmental and genetic variance on the mineral nutrient content of our advanced breeding lines. This knowledge will provide critical guidance for efforts to expand our cool season food legume breeding program into the area of improving seed nutritional profiles.

Pod height was measured at the green pod stage and at harvest maturity. Pod height index $=$ pod height at harvest maturity divided by the pod height at the green pod stage.
Plant height was measured at the green pod stage and at harvest maturity. Plant height index = plant height at harvest maturity divided by the green plant height at the green pod stage.
Rep Nodes = average number of reproducing nodes to a plant.
Agronomic data are means of three replications at Pullman, WA.
Planting Date 04/20/2010. Harvest Date: 09/06/2010.

Pod height was measured at the green pod stage and at harvest maturity. Pod height index $=$ pod height at harvest maturity divided by the pod height at the green pod stage.
Plant height was measured at the green pod stage and at harvest maturity. Plant height index = plant height at harvest maturity divided by the green plant height at the green pod stage.
Rep Nodes = average number of reproducing nodes to a plant.
Agronomic data are means of three replications at Pullman, WA.
Planting Date 04/20/2010. Harvest Date: 09/06/2010.
