Title: Management practices effects on soil carbon dioxide emission and carbon storage

Contributing scientists: U.M. Sainju, J. D. Jabro, and W.B. Stevens

Location: USDA-ARS, Northern Plains Agricultural Research Laboratory, Sidney, Montana.

Management practices can influence soil CO₂ emission and C content in cropland, which can effect global warming. We examined the effects of combinations of irrigation, tillage, cropping systems, and N fertilization on soil CO₂ flux, temperature, water, and C content at the 0 to 20 cm depth from May to November 2005 at two sites in the northern Great Plains. Treatments were two irrigation systems (irrigated vs. non-irrigated) and six management practices that contained tilled and no-tilled malt barley with 0 to 134 kg N ha⁻¹, no-tilled pea, and a conservation reserve program planting applied in Lihen sandy loam (sandy, mixed, frigid, Entic Haplustolls) in western North Dakota. In eastern Montana, treatments were no-tilled malt barley with 78 kg N ha⁻¹, no-tilled rye, Austrain winter pea, no-tilled fallow, and tilled fallow applied in dryland Williams loam (fine-loamy, mixed Typic Argiborolls). Tillage increased CO₂ flux by 62 to 118% compared with no-tillage at both places. The CO₂ flux was 1.5 to 2.5-fold greater with tilled than with non-tilled treatments following heavy rain or irrigation in North Dakota and 1.5 to 2.0-fold greater with crops than with fallow following substantial rain in Montana. Nitrogen fertilization increased CO₂ flux by 14 % compared with no N fertilization in North Dakota and cropping increased the flux by 79% compared with fallow in no-till and 0 kg N ha⁻¹ in Montana. The CO₂ flux in undisturbed CRP was similar to that in no-tilled crops. The CO₂ flux was linearly related with soil temperature and daily average air temperature at the time of CO₂ measurement. Soil organic and inorganic C contents were not influenced by treatments. Although soil C storage was not altered, management practices influenced CO₂ flux within a short period due to changes in soil temperature, water content, and nutrient levels (Sainju et al., 2008). Regardless of irrigation, CO₂ flux can be reduced from croplands to a level similar to that in CRP planting using no-tilled crops with or without N fertilization compared with other management practices (Sainju et al., 2008). No-tillage significantly reduced CO₂ emission compared with conventional tillage (Jabro et al., 2008).

As the principal in-house research arm of the U.S. Department of Agriculture, the Agricultural Research Service has a mission to: Conduct research to develop and transfer solutions to agricultural problems of high national priority and provide information access and dissemination to ensure high-quality, safe food, and other agricultural products, assess the nutritional needs of Americans, sustain a competitive agricultural economy, enhance the natural resource base and the environment, and provide economic opportunities for rural citizens, communities, and society as a whole.

The U. S. Department Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or part of an individual's income is derived from any public assistance. (Not all prohibited bases apply to all programs) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410, or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.
