ACKNOWLEDGMENT: Oil and protein determinations were made at the Northern Regional Research Center, Peoria, Illinois, under the supervision of Dr. James Cavins and Donna Thomas.

Issued March 1992

INTRODUCTION

The Soybean Production Research Program has been directed toward the development of improved strains of soybeans and the obtaining of fundamental information necessary to the efficient breeding of strains to meet specific needs. Breeding lines are developed and evaluated in the several federal and state research programs. As breeding lines demonstrate specific qualities in the individual programs, they are advanced to the preliminary and southern uniform regional tests, conducted in cooperation with research workers in the southern states. This testing program enables breeders to evaluate new strains under a wide variety of conditions, and permits new strains to be put into production in a minimum amount of time.

Eleven uniform test groups have been established to evaluate the best strains developed in the breeding programs. The groups OO through IV are adapted in the northern part of the United States, and the groups IV-S through VIII are grown in the southern part. Within their area of adaptation, there is a maturity range of 12 to 18 days within each maturity class. The best standard varieties available of each maturity class are used as check varieties with which to compare new strains as to seed yield, chemical composition, maturity, height, lodging, seed quality, and reaction to diseases and nematodes. For the groups grown in the southern area, the major check varieties are: Delsoy 4210, Manoken, Essex, Walters, Leflore, Sharkey, Stonewall, Kirby and Perrin. At Stoneville, Mississippi, where all maturity classes will mature, the approximate maturity dates of these varieties when planted during the first half of May are: Delsoy 4210, September 6; Essex, September 29; Walters, October 1; Leflore, October 16; Stonewall, October 23; and Kirby, November 4.

A wide range of soil and climatic conditions exists in the regions. As an aid in recognizing regional adaptation, the region has been subdivided into five rather broad areas which still represent a wide range of soil types. These are: (1) the East Coast, consisting of the Coastal Plain and Tidewater areas of the eastern shore of Maryland, Virginia, North Carolina, and the upper half of South Carolina; (2) the Southeast, consisting primarily of the Coastal Plain soils of the Gulf Coast area, but also including similar soil from South Carolina, southward; (3) the Upper and Central South, including the Piedmont and loessial hill soils east of the Mississippi River; (4) the Delta area, composed of the alluvial soils along the Mississippi River from southern Missouri, southward; and (5) the Southwest, comprising Arkansas and Louisiana (outside the Delta), and Oklahoma and Texas. In the Southwest area, the potential soybean-growing areas would include the alluvial soils, the Gulf Coast of Louisiana and Texas, and the high plains of Texas. In this area, several of the tests receive supplemental irrigation. A map is included to illustrate the five production areas.

On nearly all of the soils, other than the alluvial soils along the Mississippi River, fertilization is essential for satisfactory soybean production. In the Western area, irrigation is necessary for successful production. A table showing soil types, soil test information, and rate of fertilization is included.

The soil test information is based upon analyses run by laboratories with the states. Different methods are used for extraction and reporting by the various laboratories. An attempt is being made to report phosphorus and potash on a high, medium, and low basis, since pounds per acre may have different meanings in accordance with the methods used. In most cases, soil samples were taken after the soybeans were mature.

STRAIN IDENTIFICATION

The strains designated by number carry a letter prefix. This letter identifies where each strain was selected:

Au - Alabama Agricultural Experiment Station, Auburn
D - Delta Branch Experiment Station and USDA-ARS
F - Florida Agricultural Experiment Station and USDA-ARS
G - Georgia Agricultural Experiment Station
K - Kansas Agricultural Experiment Station
Ky - Kentucky Agricultural Experiment Station
L - Illinois Agricultural Experiment Station and USDA-ARS
LS - Southern Illinois University, Carbondale
La - Louisiana Agricultural Experiment Station
Md - Maryland Agricultural Experiment Station and USDA-ARS
N - North Carolina Agricultural Experiment Station and USDA-ARS
R - Arkansas Agricultural Experiment Station
S - Missouri Agricultural Experiment Station
SC - Clemson Agricultural Experiment Station
Tn - Tennessee Agricultural Experiment Station
TsB - Texas Agricultural Experiment Station, Beaumont, Texas
V - Virginia Agricultural Experiment Station

* Preliminary nursery also grown.

METHODS

The uniform nurseries were planted in 4-row plots with 3 replications. All seed was packeted at Stoneville, Mississippi for planting 19-foot rows. In most cases a 16-foot section was harvested from each of the two center rows. Randomized block designs are used for groups. Row widths at the different locations vary from 30 to 40 inches. An attempt was made to follow the best cultural and management practices in conducting these strain comparisons.

The preliminary nurseries were planted in 4-row plots with 2 replications at each of 6 to 8 locations.

Planting rate - all strains were packeted for planting at the rate of 9 seeds per foot, in 36-inch rows.

Yields are taken by harvesting a 16-foot length from the mid-section of each plot. Actual seed weights are recorded after the seed of strains have a uniform moisture content. A bushel weight of 60 pounds is used in determining bushels per acre.

Shattering notes, where taken, are on the border rows, 14 days after maturity. The estimates are recorded on a scale of 1 to 5 as follows:

| | |
|-----------------------|------------------------|
| 1 - no shattering | 4 - 9 to 19% shattered |
| 2 - 1 to 3% shattered | 5 - over 20% shattered |
| 3 - 4 to 8% shattered | |

Chemical composition - oil percent and protein percent were determined from representative locations. Percentage composition of the seed is expressed on a moisture-free basis. All chemical analyses are made at Peoria, Illinois.

Seed size for each strain was determined from a composite sample from all replications at a location. Seed size is reported for the locations where seed was analyzed for chemical composition and is reported as weight in grams per 100 seeds.

Lodging notes are recorded on a scale of 1 to 5 according to the following criteria:

- 1 - almost all plants erect
- 2 - either all plants leaning slightly, or a few plants down
- 3 - either all plants leaning moderately, or 25 to 50% of the plants down
- 4 - either all plants leaning considerably, or 50 to 80% of the plants down
- 5 - all plants down badly

Height is determined as the average length of plants in a plot from the ground to the top extremity at time of maturity.

Maturity is taken as the date when the pods are dry and most of the leaves have dropped. Under most conditions, the stems are also dry. Maturity in all summaries is expressed as days earlier (-) or later (+) than a standard or reference variety. Reference varieties used from the different uniform tests are as follows: Group IV, Manoken; Group V, Essex; Group VI, Leflore; Group VII, Stonewall; and Group VIII, Kirby.

Seed quality is rated from 1 to 5 according to the following scale:

1 - very good; 2 - good; 3 - fair; 4 - poor; 5 - very poor

The factors considered in estimating seed quality are development of seed, wrinkling damage, and brightness. While the seed quality score indicates relative appearance of seed for the several varieties at one location, considerable difference can exist among factors responsible for the poorer grades in different locations.

Disease and nematode ratings: Ratings are made on a 1 to 5 basis with 1 being resistant and 5 very susceptible or in other cases rated R - resistant, M - moderate, and S - susceptible.

All strains of V maturity and later are resistant to bacterial pustule. Very little injury was observed from phytophthora rot in 1990.

Plantings were made in the greenhouse at Athens, Georgia for *Meloidogyne incognita* and *M. arenaria* ratings and in the field near Blackville, South Carolina for *M. arenaria* ratings.

Plantings were made in the greenhouse at Jackson, Tennessee in soil infested with the soybean cyst nematode. Separate plantings were made to evaluate strains for reaction to SCN race 3 and 4.

Plantings were made in the field cage at Stoneville to evaluate for feeding by soybean looper. Plantings were made in single hills spaced 18 inches in the row with rows spaced 30 inches. Two replications were grown. A heavy population of moths were released at the time plants were in about the fourth to fifth trifoliolate state.

Statistical analyses - yield data are analyzed by analysis of variance. Differences necessary to indicate difference among strains (odds 19:1) are reported for each locations. Yield data from tests with extremely low yields or an extremely high coefficient of variability are not included in calculating averages.

UNIFORM GROUP IV-S
1991

| VARIETY OR STRAIN | PARENTAGE | GENERATION COMPOSITED |
|----------------------|---|--------------------------|
| 1. MANOKEN | L707L-3048 X D78-7424 | F5 |
| 2. DELSOY 4210 | (WILLIAMS X PI 88788) X (UNION X DOUGLAS) | F6 |
| 3. DELSOY 4710 | L77-443 X L77-906 | F5 |
| 4. LS82-3646 | FORREST X (DORMAN X WILL) | F5 |
| 5. S86-4499 | L77-443 X L77-906 | F5 |
| 6. K1170 | PERSHING X RIPLEY | F5 |
| 7. LS84-0920 | LS-78-N245 X FAYETTE | F5 |
| 8. V85-3336 | ESSEX X R77-576 | F5 |
| 9. K1192 | SHERMAN X BAY | F5 |
| 10. LS86-1922 | PYRAMID X LS78-W124-1 | F5 |
| 11. MD87-5602 | PERSHING X D77-5169 | F7 |
| 12. S88-1458 | S82-1044 X S79-4246 | F6 |

Background of lines used as parents:

L70L-3048 is a selection from L15 (Wayne Rps) X D64-31146.
D74-7824 is a selection from Forrest X D70-3001. D70-3001 is
of the same parentage as Centennial.
L77-443 is a selection from union X L75-8020. L75-8020 is a
Corsoy type resistant to phytophthora rot.
L77-906 Williams X PI 209332.
LS78-N245 is a selection from L71L-436 X 574-5.
574-5 is a SCN race 4 resistant parentage same as Bedford.
R75-576 is a selection from Forrest X Mack.
LS78-W124 is a release from Franklin X J74-5. J74-5 is closely
related to Bedford.
D77-5169 is a selection from Centennial X J74-47.
J74-47 has a parentage similar to Bedford.
S82-1044 is a selection from Cumberland X Forrest.
S79-4246 is a selection from Bedford X Crawford.

UNIFORM GROUP IV-S

1991

Uniform Group IV-S nurseries were planted at 21 locations. Results from from 20 of these locations are summarized in Tables 1-7. Table 1 gives a general summary of information including three year means for seed yield, oil and protein. Tables 2 - 6 report data from individual locations.

The cultivar Manoken recently released by the Maryland Agriculture Experiment Station had a mean seed yield of 50 bushels per acre for the twenty locations. Manoken is of late 4 S maturity. The breeding line K1192 had a mean seed yield of 49.1 bushel per acre and is 10 days earlier in maturity.

The two highest yielding entries Manoken and K1192 had the highest percentage of seed coat mottling in the planting at Orange, Virginia. Manoken had 27% of the seed showing mottling and K1192 had 8%. All other entries were 5% to 0. The seed coat mottling is assumed to be associated with soybean mosaic virus infection. All strains were rated for reaction to soybean cyst nematode races 3 and 4 in the greenhouse at Jackson, Tn. Results are reported as resistant or susceptible. All entries were also evaluated for feeding by soybean looper in the field cage at Stoneville. All were susceptible to feeding.

PRELIMINARY GROUP IV-S

1991

Preliminary Group IV-S nurseries, which included Delsoy 4210, Manoken, 31 experimental entries, and three Chinese varieties were grown at 8 locations. Data was obtained from seven of the locations. The parentage for each of the entries is reported in Table 8. Table 9 gives a general summary of performance and Tables 10-14 report data from the individual locations.

Manoken had an overall mean seed yield of 49.6 bushels per acre, ranked highest in seed yield. Delsoy 4210 had a mean seed yield of 43.7 bushels per acre. Five lines yielded significantly less than Delsoy. The three Chinese varieties also yielded significantly less than Delsoy 4210. Two of the lower yielding lines were high protein low oil entries, but the third high protein entry MD87L-0918 had an overall mean yield of 41.3 bushels per acre, 51% protein and 14.1% oil. It's mean seed yield was only slightly below that for Delsoy 4210.

All entries were screened for reaction to cyst nematode races 3 and 4 in the greenhouse at Jackson, Tennessee. Thirteen of the experimental lines were rated resistant to SCN race 3. Five of these were also rated resistant to race 4, while three additional lines were considered heterogeneous in reaction to race 4.

| VARIETY OR STRAIN | PARENTAGE | GENERATION COMPOSITED |
|----------------------|------------------------|--------------------------|
| 1. ESSEX | LEE X S55-7075 | F5 |
| 2. WALTERS | FORREST X NAROW | F5 |
| 3. HARTWIG | FORREST(3) X PI 437654 | F5 |
| 4. N86-7687 | N77-114 X PIXIE | F5 |
| 5. TN85-157 | D72-8927 X TN80-83 | F5 |
| 6. KY85-11020 | ESSEX X ELF | F5 |
| 7. N87-325 | N77-114 X N77-179 | F5 |
| 8. D88-5522 | D82-3298 X D77-6056 | F5 |
| 9. N86-7682 | N77-114 X PIXIE | F5 |
| 10. S86-1474 | S79-4240 X ESSEX | F6 |
| 11. S86-2469 | S79-4296 X D77-5169 | F6 |
| 12. S88-1855 | ESSEX(2) X PI 90763 | F6 |

Background of lines used as parents:

S55-7075 is a selection from N48-1248 X Perry which was grown in Uniform Group VI. N48-1248 has the same parentage as Hood.

N77-114 is a selection from Essex X N70-2173. N70-2173 was grown in Uniform Group VI in 1980.

D72-8927 is a selection from D66-12392 X (Hill(2) X PI 90763).

Tn80-83 is a selection from Essex X J74-40.

N77-179 is a selection from N70-1549 X N77-3213 was grown in Uniform Group V in 1982.

D82-3298 is a selection from Bedford X sel (Forrest X D75-10169) grown in Uniform Group V in 1985.

D77-6056 is a selection from Centennial X J74-47 grown in Uniform Group V in 1982-84.

S79-4240 is a selection from D70-3045 X Bedford.

D70-3045 is the same parentage as Centennial.

S79-4296 is a selection from Bedford X Crawford.

D77-5169 is a selection from Centennial X J74-47.

J74-47 is of the same parentage as Bedford.

UNIFORM GROUP V

1991

Uniform Group V nurseries were planted at 32 locations. Results from twenty-nine of these locations are summarized in Tables 15-21. Table 15 gives a general summary of performance including three year mean seed yield and oil and protein percentages. Data are also presented for pest reaction and agronomic characteristics. Data from individual locations are summarized in Tables 16-21.

The overall mean seed yields for name varieties were Essex 41.3 bushels per acre, Walters 44.6 bushels per acre and Hartwig 42.2 bushels per acre. The highest yielding entry was N87-325 with a mean seed yield of 48 bushels per acre.

All entries were rated for reaction to the two root knot nematodes *Meloidigyne incognita* and *M. arenaria* in the greenhouse at Athens, Georgia. Each pot was infested with a specific number of eggs. Ratings were on a 1 to 5 basis, with 1 being highly resistance. Relative to field performance a rating of 2.5 would be considered a fairly good level of resistance for *M. arenaria*. Entries were also rated for reaction to soybean cyst nematode races 3 and 4 in the greenhouse at Jackson, Tennessee. The variety Hartwig has a broad range resistance to the soybean cyst nematode which gives it resistance to all recognized biotypes. It also has good resistance to *M. incognita*, but is susceptible to *M. arenaria*. D88-5522 has resistance to both root knot nematodes and to races 3 and 4 of the soybean cyst nematode. TN85-157 is resistance to SCN race 5.

Stem canker ratings were made in the field at Beaumont, Texas. Ratings were made on a 0 to 9 basis. Seed coat mottling ratings were made from harvest at Orange, Virginia with actual percentages reported. Ratings for soybean looper feeding were made in the field cage at Stoneville with ratings made on a 1 to 5 basis, with 5 indicating very severe feeding.

TABLE 15 - GENERAL SUMMARY OF PERFORMANCE FOR THE STRAINS GROWN IN UNIFORM
GROUP V, 1991

PRELIMINARY GROUP V

1991

Preliminary Group V nurseries, which included Forrest and Manoken, along with 34 experimental strains were grown at 8 locations. The parentage of each of the entries is reported in Table 22. A general summary of performance is reported in Table 23. Data from individual locations are reported in Tables 24-28.

Forrest had an overall mean seed yield of 45.9 bushels per acre and Manoken an overall seed mean yield of 49.2 bushels per acre. There were no experimental entries having a mean seed yield significantly higher than that for Forrest and there were two strains having a mean seed yield significantly lower than that for Forrest. D88-5547 with an overall mean seed yield of 51 bushels per acre was rated resistance to SCN race 3 and 4 and was also rated resistance to feeding by soybean looper.

MD87L-0287 had a protein percentage of 55.2 and an oil percentage of 14.6. It's yield was relatively low, but this was in part related to its susceptibility to phytophthora rot. Phytophthora rot was considered a factor in the plantings at Plymouth and on Stoneville clay. In Replication 1, on Stoneville clay, the high protein line was adjacent to Forrest and yields were nearly similar. However, in Rep 2, MD87L-0285 was badly damaged by phytophthora rot.

In the greenhouse evaluation for soybean cyst nematode at Jackson, Tennessee seventeen of the experimental entries were rated resistant to race 3 and 12 of these were rated resistant or heterogeneous for reaction to race 4. Four lines S88-1934, S88-1988-4, S88-2331, and S88-7166 have the broad range of SCN resistance similar to that of Hartwig.

TABLE 22 - PARENTAGE OF THE STRAINS GROWN IN PRELIMINARY GROUP V, 1991

| 11. S87-1551 | ESSEX X EPPS | F6 |
| 12. SC84-931 | CENTENNIAL X YOUNG | F5 |

Background of lines used as parents:

J74-47 is a SCN race 4 selection of the same parentage as Bedford.
D76-9665 is a selection from Forrest X D70-3001 which was grown in Uniform Group VI 1977-1979. D77-3001 is of the same parentage as Centennial.
N77-1602 is a selection from Hunter X N70-2205. N70-2205 is a selection from Hampton X Ransom.
F77-1797 is a selection from Centennial X (Forrest X (Cobb X D68-216)).
CO 79-760 is a selection from CO 73-473 X Centennial grown in Preliminary Group VIII, 1981.
N77-114 is a selection from Essex X N70-2173. N70-2173 was grown in Uniform Group Vi in 1980.
D82-2218 is a selection from Bedford X Tracey-M.
J80-293 is a selection from J74-39 X Centennial.
J74-39 is of the sme parentage as Bedford.
N81-320 is a selection from N73-40 X N73-520-4 grown in Uniform V, 1984.
N79-856 is a selection from Essex X N70-3037 grown in Preliminary Group VI, 1981.

UNIFORM GROUP VI

1991

Uniform Group VI nurseries were planted at 30 locations. Results from 29 of these plantings are summarized in Tables 29-35. Table 29 gives a general summary of performance including three year means for seed yield, oil, and protein percentages, along with information on reaction to pest and general characteristics. Data from individual locations are reported in Tables 30-35.

Leflore had an overall mean seed yield 42.2 bushels per acre and Sharkey a mean of 42.6 bushels per acre. D87-4429 a selection from Sharkey X Leflore had a mean seed yield of 48.6 bushels per acre which was significantly higher than that for either parent. N86-491 which was being grown a third year had a mean seed yield of 47.3 bushels per acre.

D87-5870 has been evaluated two years and is being considered as a possibility for release for production on the clay soils of the Delta. It is slightly earlier in maturity than Sharkey and has good root knot resistance, along with resistance to SCN race 3. Previously, it was rated resistance to SCN race 4 but in this years rating it was rated susceptible. It also has a moderate level of resistance to feeding by soybean looper and is highly resistant to stem canker.

Ratings for reaction to the two root knot nematode *M. incognita* and *M. arenaria* were made in the greenhouse at the University of Georgia. Ratings for reaction to soybean cyst nematode races 3 and 4 (14) were made in the greenhouse at Jackson, Tennessee. Ratings for feedings by soybean looper were made in the field cage at Stoneville, where a high population of moths were released for egg laying and development of larve on the individual strains. Ratings for stem canker were made in the nursery at Beaumont, Texas with naturally developing disease conditions. Ratings were on a 0 to 9 basis.

PRELIMINARY GROUP VI

1991

Preliminary Group VI nurseries, which included Sharkey and Bedford, along with 34 experimental entries, were grown at 7 locations. The Parentage for each of the entries is reported in Table 36. A general summary of performance is given in Table 37. Data from individual locations are reported in Tables 38-42.

The mean seed yield for the seven locations range from 35.4 bushels per acre to 46 bushels per acre. Sharkey had a mean seed yield of 42.8 bushels per acre. There were no experimental lines having a mean seed yield significantly higher than that for Sharkey. There were four lines having a mean seed yield significantly lower than that for Sharkey. V89-2372 had an overall mean seed yield of 44.3 bushels per acre. The performance of this line is of particular importance because it is essentially Essex converted to a later maturity. Essex has a long history of good performance as a Group V variety and it is of a special interest to see that it also yields well when converted to the later maturity.

Twenty-seven of the experimental strains were rated resistant or heterogeneous for reaction to Race 3 in the greenhouse at Jackson, Tennessee. Eighteen of these lines were also resistant or heterogeneous for reaction to SCN Race 4. S88-1995 has the same broad range of resistance to SCN as does Hartwig.

| 12. N88-431 | N84-1299 X N82-2037 | F6 |

Background of lines used as parents:

N73-693 is a selection from D68-216 X Ransom which was grown in Uniform Group VI in 1977. D68-216 is a SCN race 3 resistant selection of the same parentage as Forrest.
F76-8757 is a SCN race 3 resistant line from Centennial X (Forrest X (Cobb X D68-216)).
D77-6103 is a selection from Centennial X J74-57.
N77-940 is a selection from N77-1540 X Centennial grown in Uniform VII in 1980.
N79-856 is a selection from Essex X N70-3037.
D77-9665 is a selection from Forrest X Centennial.
J80-293 is a selection from J74-39 X Centennial.
 J74-39 is of the same parentage as Bedford.
D79-6058 has same parentage as Sharkey.
N84-1299 RS4- cycle 1
N82-2037 is a selection from N73-1102 X 330-26-29-4 grown in Preliminary VII, 1984.

UNIFORM GROUP VII

1991

Uniform Group VII nurseries were planted at 23 locations. Results from 22 of these plantings are reported in Tables 43-49. Table 43 gives a general summary of performance including three year means for seed yield and oil and protein percentages along with reaction to pest and general agronomic characteristics. Data from individual locations are reported in Tables 44-49.

Stonewall had an overall mean seed yield of 46.1 bushels per acre. There were no experimental lines having a higher mean seed yield. G84-3185 which equaled Stonewall in seed yield is somewhat more resistant to *M. incognita* than Stonewall and also appeared more resistant to stem canker.

Ratings for reaction to the two root knot nematodes were made in the greenhouse at the University of Georgia and ratings for reaction to SCN races 3 and 4 (14) were made in the greenhouse at Jackson, Tennessee. G85-373 appeared resistant to both races of the root knot nematode and to SCN race 3. AU87-547 was rated moderately resistance to *M. incognita*, good resistance to *M. arenaria*, and resistant to SCN races 3 and 4. It's mean seed yield was 45.2 bushels per acre.

Stem canker ratings were made at Beaumont, Texas, based upon a naturally developing infection. Ratings were on the basis of a 0 to 9 scale. Hagood received a rating of 2. In a planting in Mississippi where a heavy level of stem canker developed on susceptible material, Hagood had a seed yield of 6 bushels per acre as compared with 40 bushels per acre with Stonewall. Hagood appeared to be very susceptible to stem canker development.

Ratings for soybean looper feeding were made in the large field cage at Stoneville where moths were released to lay eggs on the material. Entries receiving a rating of 5 would have over 80% defoliation.

PRELIMINARY GROUP VII

1991

Preliminary Group VII nurseries, which included Stonewall and Sharkey along with 34 experimental entries, were grown at 9 locations. The parentage of each of the entries is reported in Table 50. A general summary of performance is reported in Table 51. Data from individual locations are reported in Tables 52-56.

Stonewall had an overall mean seed yield of 44.3 bushels per acre. There were no lines having a significantly higher mean seed yield. There were 16 lines having a significantly lower mean seed yield. Only two lines ranked slightly above Stonewall in seed yield. V88-970 had a mean seed yield of 40.9 bushels per acre. This line is basically Essex converted to later maturity to determine whether the productivity of Essex would be maintained in a later maturing environment.

In the planting at Jackson, Tennessee to evaluate for reaction to soybean cyst nematode 21 of the experimental entries were rated resistant to SCN race 3 and 9 of these were also rated resistant to SCN race 4 (14). Soybean looper ratings were made in the field cage at Stoneville where a high population of moths were released for egg laying. All of the entries rated resistant yielded significantly less than Stonewall. Ratings for reaction to stem canker were made in the field at Beaumont, Texas, where ratings were made on a 0 to 9 basis.

There were no North Carolina entries in the 1991 plantings. Seed sent by United Parcel Services was lost in route.

| 12. SC88-2660 | KIRBY X (GORDON X D77-6056) | F5 |

Background of lines used as parents:

D68-216 is a selection from Dyer X Bragg
D76-9665 is a selection From Forrest X Centennial.
F84-1569
F77-2000 same parentage as Kirby.
D77-6056 is a selection from Centennial X J74-47.
 J74-47 is a SCN race 4 resistant line with same
 parentage as Bedford.

UNIFORM GROUP VIII

1991

Uniform Group VIII nurseries were grown at 16 locations. Results of 15 of these plantings are summarized in Table 57, which also reports three year means for seed yield and percent protein and oil along with information on pest reaction and general agronomic qualities. Data from individual locations are reported in Tables 58-63.

The recently released Cook cultivar had a mean seed yield of 46.2 bushels per acre, which was 10 bushels per acre above the mean seed yield for Kirby. Cook averaged three days earlier in maturity than did Kirby. Perrin, which averaged 1.5 days later in maturity than Kirby had a significantly higher mean seed yield. The strain SC84-679 had a mean seed yield of 44 bushels per acre which was significantly higher than that for Perrin. This strain is being increased for release. F88-1456 equalled Perrin in seed yield has good resistance to both root knot nematodes and also is resistant to SCN race 3 and to stem canker. G84-234 also has excellent resistance to both root knot nematodes and is resistant to SCN race 3.

The entries were evaluated for reaction to the two root knot nematodes in the greenhouse at the University of Georgia. It is of particular interest that 11 of the 12 entries had good resistance to *M. incognita* and seven had moderate to good resistance to *M. arenaria*. All entries were evaluated for reaction to SCN races 3 and 4 in the greenhouse at Jackson, Tennessee. One line SC86-2660 had good resistance to both races of root knot nematode and also resistance to both races of soybean cyst nematode. Ratings for stem canker were made in the field at Beaumont, Texas, on the basis of a rating of 0-9.

PRELIMINARY GROUP VIII

1991

Preliminary Group VIII nurseries, which included Kirby and Hagood, along with 34 experimental entries, were grown at 6 locations. The parentage for each of the entries is reported in Table 64. A general summary of performance is given in Table 65. Data from individual locations are reported in Tables 66-70.

The mean seed yield for the several locations range from 26.6 bushels per acre to 36.2 bushels per acre. Kirby had a mean seed yield of 29.1 bushel per acre. Only one line had a significantly higher mean seed yield.

Nearly all of the entries were resistant to SCN race 3, ten of them were also either resistant or heterogenous for reaction to SCN race 4.

Ratings for soybean looper feeding were made in the field cage at Stoneville where a high population of moths were released for egg laying. Ratings for stem canker (SC) were made in the field at Beaumont, Texas. The entries in Preliminary Group VIII were rated at a later date than were entries in the other maturity groups, giving the disease more time to develop on susceptible strains. Strains receiving a rating of zero in the first rating, remained zero in the second rating. However, ratings for the more susceptible lines showed an increase. Hagood which appeared very susceptible in a Mississippi planting had a rating change from a 2.5 to 3.5. Five strains received ratings of zero.

TABLE 64 - PARENTAGE OF THE STRAINS GROWN IN PRELIMINARY GROUP VIII, 1991
