## INTRODUCTION

The Soybean Production Research Program has been directed toward the development of improved strains of soybeans and the obtaining of fundamental information necessary to the efficient breeding of strains to meet specific needs. Breeding lines are developed and evaluated in the several federal and state research programs. As breeding lines demonstrate specific qualities in the individual programs, they are advanced to the preliminary and uniform regional tests, conducted in cooperation with research workers in the southeastern states. This testing program enables breeders to evaluate new strains under a wide variety of conditions, and permits new strains to be put into production in a minimum amount of time.

Eleven uniform test groups have been established to evaluate the better strains developed in the breeding programs. The groups 00 through IV are adapted in the northern part of the United States, and the groups IV-S through VIII are grown in the southern part. Within their area of adaptation, there is a maturity range of 12 to 18 days within each maturity class. The best standard varieties available of each maturity class are used as check varieties with which to compare new strains as to seed yield, chemical composition, maturity, height, lodging, seed quality, and reaction to diseases and nematodes. For the groups grown in the southern area, the major check varieties are: Douglas, Essex, Forrest, Tracy-M, Centennial, Braxton, Wright, Hutton, and Cobb. At Stoneville, Mississippi, where all maturity classes will mature, the approximate maturity dates of these varieties when planted during the first half of May, are: Douglas, September 7; Essex, September 25; Forrest, October 1; Tracy-M, October 13; Centennial, October 16; Braxton, October 25; Hutton, November 1; and Cobb, November 6.

A wide range of soil and climatic conditions exists in the regions. As an aid in recognizing regional adaptation, the region has been subdivided into five rather broad areas which still represent a wide range of soil types. These are: (1) the East Coast, consisting of the Coastal Plain and Tidewater areas of the eastern shore of Maryland, Virginia, North Carolina, and the upper half of South Carolina; (2) the Southeast, consisting primarily of the Coastal Plain soils of the Gulf Coast area, but also including similar soil from South Carolina, southward; (3) the Upper and Central South, including the Piedmont and loessal hill soils east of the Mississippi River; (4) the Delta area, composed of the alluvial soils along the Mississippi River from southern Missouri, southward; and (5) the Southwest, comprising Arkansas and Louisiana (outside the Delta), and Oklahoma and Texas. In the Southwest area, the potential soybean-growing areas would include the alluvial soils, the Gulf Coast of Louisiana and Texas, and the high plains of Texas. In this area, several of the tests receive supplemental irrigation. A map is included to illustrate the five production areas.

On nearly all of the soils, other than the alluvial soils along the Mississippi River, fertilization is essential for satisfactory soybean production. In the Western area, irrigation is necessary for successful production. A table showing soil types, soil test information, and rate of fertilization is included.

The soil test information is based upon analyses run by laboratories with the states. Different methods are used for extraction and reporting by the various laboratories. An attempt is being made to report phosphorus and potash on a high, medium, and low basis, since pounds per acre may have different meanings in accordance with the methods used. In most cases, soil samples were taken after the soybeans were mature.

## STRAIN IDENTIFICATION

The strains designated by number carry a letter prefix. This letter identifies where each strain was selected:

- Co - Coker's Pedigreed Seed Company, Hartsville, South Carolina
- D - Delta Branch Experiment Station and USDA-ARS
- F - Florida Agricultural Experiment Station and USDA-ARS
- Ga - Georgia Agricultural Experiment Station
- J - Delta Branch Experiment Station, West Tennessee Experiment Station and USDA-ARS
- L - Illinois Agricultural Experiment Station and USDA-ARS
- La - Louisiana Agricultural Experiment Station
- Md - Maryland Agricultural Experiment Station and USDA-ARS
- N - North Carolina Agricultural Experiment Station and USDA-ARS
- R - Arkansas Agricultural Experiment Station
- S - Missouri Agricultural Experiment Station and USDA-ARS
- Tn - Tennessee Agricultural Experiment Station
- Ts - Texas Agricultural Experiment Station
- UD - Delaware Agricultural Experiment Station
- V - Virginia Agricultural Experiment Station

NOTE: A T in a Ga number indicates selection made at Tifton.

A second L in an L number indicates selection made in southern Illinois at Eldorado.

This annual report of activity of the Soybean Production Research Program, as well as that of the state stations which cooperate, is a progress report and as such may contain statements which may or may not be verified by subsequent experiments. The fact that any statement has been made herein does not necessarily constitute publication. For this reason, citation to particular statements in the report should not be published unless permission has been granted previously by those concerned.

1 Fertilizer applied converted to pounds N,  $P_{2.5}^0$ ,  $K_2^0$ . For example: 400# of 2-12-12 equals 8-48-48.

2 Varieties: A = Douglas; B = Essex; C = Forrest; D = D77-5090; E = Tracy-M; F = Centennial; G = Braxton;  
H = Wright; I = Foster; J = Kirby.

\*Preliminary nursery also grown.

### METHODS

The uniform nurseries were planted in 4-row plots with 3 replications. All seed was packeted at Stoneville, Mississippi for planting 19-foot rows. In most cases a 16-foot section was harvested from each of the two center rows. Randomized block designs are used for groups. Row widths at the different locations vary from 30 to 40 inches. An attempt was made to follow the best cultural and management practices in conducting these strain comparisons.

The preliminary nurseries were planted in 4-row plots with 2 replications at each of 4 to 8 locations.

Planting rate - all strains were packeted for planting at the rate of 9 seeds per foot.

Yields are taken by harvesting a 16-foot length from the mid-section of each plot. Actual seed weights are recorded after the seed of strains have a uniform moisture content. A bushel weight of 60 pounds is used in determining bushels per acre.

Shattering notes, where taken, are on the border rows, 14 days after maturity. The estimates are recorded on a scale of 1 to 5 as follows:

1 - no shattering	4 - 9 to 19% shattered
2 - 1 to 3% shattered	5 - over 20% shattered
3 - 4 to 8% shattered	

Chemical composition - oil percent and protein percent were determined from representative locations. Percentage composition of the seed is expressed on a moisture-free basis. All chemical analyses are made at Peoria, Illinois.

Seed size for each strain was determined from a composite sample from all replications at a location. Seed size is reported for the locations where seed was analyzed for chemical composition and is reported as weight in grams per 100 seeds.

Lodging notes are recorded on a scale of 1 to 5 according to the following criteria:

1 - almost all plants erect
2 - either all plants leaning slightly, or a few plants down
3 - either all plants leaning moderately, or 25 to 50% of the plants down
4 - either all plants leaning considerably, or 50 to 80% of the plants down
5 - all plants down badly

Height is determined as the average length of plants in a plot from the ground to the top extremity at time of maturity.

Maturity is taken as the date when the pods are dry and most of the leaves have dropped. Under most conditions, the stems are also dry. Maturity in all summaries is expressed as days earlier (-) or later (+) than a standard or reference variety. Reference varieties used from the different uniform tests are as follows: Group IV, Douglas; Group V, Essex; Group VI, Centennial; Group VII, Braxton; and Group VIII, Hutton.

Seed quality is rated from 1 to 5 according to the following scale:

1 - very good; 2 - good; 3 - fair; 4 - poor; and 5 - very poor

The factors considered in estimating seed quality are development of seed, wrinkling damage, and brightness. While the seed quality score indicates relative appearance of seed for the several varieties at one location, considerable difference can exist among factors responsible for the poorer grades in different locations.

Disease and nematode ratings: Ratings are made on a 1 to 5 basis with 1 being resistant and 5 very susceptible or in other cases rated R - resistant, M - moderate, and S - susceptible.

All strains of V maturity and later are resistant to bacterial pustule. Very little injury was observed from phytophthora rot in 1982.

Plantings were made at Jay, Florida, for Meloidogyne incognita ratings and at Blackville, South Carolina for M. arenaria ratings.

Plantings were made at Ames Plantation in Tennessee on SCN race 3 infested soil. Ratings were made on the basis of late season cyst counts. SCN race 4 ratings were based upon field plantings at Tiptonville.

Statistical analyses - yield data are analyzed by analysis of variance. Differences necessary to indicate difference among strains (odds 19:1) are reported for each location. Yield data from tests with extremely low yields or an extremely high coefficient of variability are not included in calculating averages.

UNIFORM GROUP IV-S

1982

<u>Variety or strain</u>	<u>Parentage</u>	<u>Generation composited</u>

4. D77-18	Tracy X Forrest	F <sub>5</sub>
5. Md77-5675	V68-1171 X Columbus	
6. S77-7992	Forrest X V71-480	F <sub>4</sub>
7. V76-411	Essex X SRF-400	F <sub>5</sub>
8. LS78-248	L71L-436 X J74-5	F <sub>5</sub>
9. V78-444	Essex mutant	
10. V78-105	V68-1034 X V71-380	F <sub>5</sub>
11. V78-713	Essex X V68-1171	F <sub>5</sub>
12. V78-727	Essex X V68-1171	F <sub>5</sub>

Background of breeding lines used as parents:

D67-3297 is a selection from Hill(2) X PI 171450 which was tested in Uniform IV-S.

V68-1171 is a selection from PI 80837 X V63-76 which was grown in Uniform Group V in 1974.

V71-480 is a selection from V63-76 X V66-318 which was grown in Uniform IV-S in 1974.

J74-5 is a SCN race 4 resistant line of the same parentage as Bedford.

V68-1034 is a selection from Dare X PI 71506 which was evaluated in Preliminary Group V in 1971.

Results of 18 Uniform Group IV-S nurseries are summarized in Tables 1 through 7. Table 1 gives a general summary of performance and characteristics of each variety or strain.

S76-2109 has been evaluated 4 years. Its three-year mean seed yield is good in all areas. Average maturity is 8 to 10 days later than Douglas. D77-18 and Md77-5675 have been evaluated three years. D77-18 is resistant to race 3 of the soybean cyst nematode. It has yielded below Douglas in all but the Delta area. Md77-5675 has had an average seed yield below that of Douglas in all production regions.

The two strains, S77-7992 and V76-411, have been evaluated two years. Seed yield of S77-7992 averaged below that for Douglas in each of the production regions. V76-411 yielded slightly below Douglas in the East Coast area, but had an average seed yield above that for Douglas in the other production areas.

Five strains, LS78-248, V78-444, V78-105, V78-713, and V78-727, have been evaluated one year. V78-444, V78-713, and V78-727 appear to merit further testing. These three strains, along with V78-105, appear to be resistant to soybean mosaic virus.

PRELIMINARY GROUP IV-S

1982

Preliminary Group IV-S nurseries, including 22 experimental strains along with Douglas and Hill, were grown at 7 locations. The parentage of each of these strains is reported in Table 8. Performance data are summarized in Tables 8 through 14.

The variety Hill was included as a maturity check. Strains of Hill maturity or later are considered as being too late to be considered of IV-S maturity. Five strains, K1092, LS79-238, R79-5584, S78-1135, and V79-800, were considered as being of Group V maturity. Only two strains, V79-1397 and V79-2856, were earlier in maturity than Douglas.

Douglas had a mean seed yield of 45.2 bushels per acre. Four strains had higher mean seed yields. These were V79-1362, V79-1387, V79-1397, and V79-2856. Two strains, LS79-220 and S79-4259, had good seed yields and were rated resistant to SCN race 3.

Strains which appear to merit further evaluation in Uniform Group IV-S are LS79-220, S79-4259, V79-1362, V79-1387, V79-1393, and V79-2856.

Table 8 - Parentage of the strains grown in Preliminary Group IV-S, 1982

Variety or strain	Parentage	Generation composited
1. Douglas	Williams X Crawford	F <sub>5</sub>

Background of breeding lines used as parents:

S5-7075 is a selection from N48-1248 X Perry which was grown in Uniform Group VI. N48-1248 has the same parentage as Hood.

D68-18 is a selection from Dyer X Bragg.

J74-47 is a SCN race 4 selection of the same parentage as Bedford.

N70-1549 is a selection from Dare X D65-6765 which was grown in Uniform Group V in 1974.

N72-3213 is a selection from D67-B5 X N64-2451 which was grown in Preliminary Group VII in 1974.

R66-873 is a selection from Jackson X Semmes which was grown in Preliminary Group VI in 1970.

V12-128 is a selection from PI 96983 X V66-318. It was evaluated in Uniform Group V in 1975.

D70-3115 is of the same parentage as Centennial but of slightly earlier maturity.

UNIFORM GROUP V, 1982

Uniform Group V nurseries were planted at 32 locations. Additional plantings were made at Blackville, South Carolina to evaluate for M. arenaria, at Jay, Florida to evaluate for M. incognita, and at Ames Plantation in Tennessee to evaluate for SCN race 3. Plantings were made in the field cage at Stoneville to evaluate for foliar-feeding insects. Results are summarized in Tables 15 through 21. Table 15 gives a general summary of seed yields, oil and protein percentages, growth characteristics, and reaction to diseases and nematodes. Insect feeding in the cage at Stoneville was insufficient for evaluating strains.

SCN race 1 was present where the plantings were made at Holland, Virginia, and SCN race 4 was present where the plantings were made at Tiptonville, Tennessee.

The three-year mean seed yield for Forrest was slightly higher than that for Essex in each of the production regions. Nathan, D77-5090, and N77-179 have been evaluated 3 years. Nathan has produced well on race 4 cyst nematode infested soil in northwest Tennessee, but its overall average seed yield is lower than that for Essex and Forrest. D77-5090 is also resistant to SCN race 4. In addition, it is resistant to SMV and has the Arksoy gene for resistance to phytophthora rot. Its three-year mean seed yield is nearly similar to that for Essex. D77-5090 is being proposed for increase and release as a variety. The three-year mean seed yield for N77-179 closely approximates that for Essex. Seed yield is slightly below that for Essex in the East Coast and West regions and slightly above in the Upper and Central South and Delta. D77-5169 and R74-511 have been evaluated two years. D77-5169 is resistant to both SCN races 3 and 4. Its two-year mean seed yield is above that for Forrest in all but the Western region and in that region it equaled Forrest in seed yield.

Five strains were advanced from the 1981 Preliminary Group V nursery. D77-5147 and D77-6056 are both resistant to races 3 and 4 of the cyst nematode. D77-6056 also received low ratings for both of the root knot nematodes M. incognita and M. arenaria. N79-2337 received a low rating for M. arenaria. D77-6056 and S76-2425 appear to merit further evaluation.

Table 15 - General summary of performance of the strains in Uniform Group V, 1982

PRELIMINARY GROUP V

1982

Plantings of Preliminary Group V nurseries, which included 34 experimental strains along with Forrest and Hill, were made at 8 locations. The parentage of each strain is reported in Table 22. Table 23 gives a general summary of performance. Additional data are summarized in Tables 24 through 28. Plantings at Tiptonville, Tennessee were on soil infested with SCN race 4.

Three strains, R80-359, R80-721, and R80-753, are considered too late in maturity to be evaluated as Group V maturity. Eighteen strains were rated resistant to SCN race 3, and three additional strains were considered to be segregating. Ten strains were considered to be resistant to SCN race 4. All strains resistant to SCN race 4 were also resistant to SCN race 3. Two of the strains having J74-88 as a parent were rated resistant to SCN race 5.

The mean seed yield for Forrest was 42.3 bushels per acre. Only two strains had seed yields slightly above that for Forrest. S79-4240 had a mean yield of 42.4 bushels per acre, and Th77-119 had a seed yield of 42.8 bushels.

Strains which appear to merit advance into Uniform Group V are D79-7858, LS79-330, R76-479, S79-4060, and S79-4240.

UNIFORM GROUP VI

1982

<u>Variety or strain</u>	<u>Parentage</u>	<u>Generation composited</u>
1. Centennial	D64-4636 X tawny pubescent Pickett 71 type	F <sub>5</sub>
2. Tracy-M	Metribuzin tolerant sel. from Tracy X (D61-618 X D60-9647)	F <sub>10</sub>
3. Jeff	Centennial X [R72-2647(3) X sel (D68-18 X PI 88788)]	F <sub>3</sub>
4. D77-6057	Centennial X J74-47	F <sub>5</sub>
5. N77-114	Essex X N70-2173	F <sub>5</sub>
6. D77-6166	Centennial X J74-47	F <sub>5</sub>
7. D78-5502	Forrest(2) X Tracy	F <sub>5</sub>
8. D79-6058	Tracy X Centennial	F <sub>5</sub>
9. N79-491	N70-1501 X Centennial	F <sub>6</sub>
10. N79-606	Essex X Centennial	F <sub>6</sub>
11. R79-167S	R72-26 X Forrest	F <sub>5</sub>
12. Bradley (S77-281)	D70-3115 X J74-39	F <sub>4</sub>

Background of breeding lines used as parents:

D64-4636 is a selection from Hill X D58-3311. D58-3311 is a bacterial pustule resistant strain selected from Jackson(4) X D49-2491.

J74-47 is a SCN race 4 selection of the same parentage as Bedford.

N70-2173 is a selection from Hutton X Ransom.

N70-1501 is a selection from Dare X D65-6765 which was evaluated in Uniform Group VI, 1974-76.

D70-3115 is of the same parentage as Centennial.

J74-39 is of the same parentage as Bedford.

Plantings of Uniform Group VI nurseries were made at 32 locations. Additional plantings were made at Blackville, South Carolina for evaluating strain reaction to Meloidogyne arenaria, at Jay, Florida for evaluation against M. incognita, and at Ames Plantation in Tennessee for evaluation against SCN race 3. The plantings at Jay, Florida were on soil infested with SCN race 3 and at Holland, Virginia were on a field infested with SCN race 1. Results are summarized in Tables 29 through 35. Table 29 gives a general summary of seed yields, oil and protein content, growth characteristics, and reaction to diseases and nematodes.

The variety Jeff was released to provide a variety of Group VI maturity with resistance to SCN race 4. In these plantings, the three-year mean seed yields for Jeff are similar to those for Centennial. However, in plantings at the Northeast Branch Station at Verona, Mississippi where stem canker is a problem, seed yield for Jeff has averaged 20 to 25% below that for Centennial because of injury from stem canker. The two strains, D77-6057 and N77-114, have also been evaluated three years. Both have yielded well. D77-6057 is resistant to SCN races 3 and 4. It also has good resistance to M. incognita, but is susceptible to M. arenaria.

The two strains, D77-6166 and D78-5502, have been evaluated two years. D77-6166 is resistant to SCN races 3 and 4 and has good resistance to M. incognita. It has produced well under stem canker conditions at Verona, Mississippi. It is being considered for possible increase and release. D78-5502 is resistant to SCN race 3 and to M. incognita.

Five strains were evaluated one year. Four of these are resistant to SCN race 3. Two have good resistance to M. incognita and one to M. arenaria. D79-6058, N79-491, and R79-167S appear to merit further evaluation. The strain, S77-281, has been released as Bradley. Bradley is resistant to SCN races 3 and 4, and is similar in maturity to Jeff. It does not appear to offer any production advantages over Jeff. Its reaction to stem canker at Verona appears similar to that for Jeff.

PRELIMINARY GROUP VI

1982

Preliminary Group VI nurseries, which included 34 experimental strains along with Centennial and Bedford, were planted at eight locations. The parentage of the strains included is reported in Table 36. Table 37 gives a summary of seed yield, oil and protein percentages, and reaction to several diseases and nematodes. Data from individual locations are reported in Tables 38 through 42.

An incomplete stand was obtained in a planting near Jackson, Tennessee on a soil infested with SCN race 4. Harvest of the material in the planting at Plymouth, North Carolina was delayed appreciably because of a prolonged wet period.

The mean-seed yield for Centennial for six locations was 42.3 bushels per acre. Seventeen strains had seed yields which ranked above Centennial. The highest yielding strain was D79-6162, which had a mean-seed yield of 51 bushels per acre. Fifteen strains were rated resistant to SCN race 3, and 7 strains were resistant to both SCN races 3 and 4. There were 4 strains, D80-7987, J80-293, J80-337, and R80-759, which received low ratings for both species of root-knot nematodes as well as for SCN races 3 and 4. D80-7987 had been selected for resistance to soybean mosaic virus and was free of seed coat mottling at Plymouth. J80-337 had proved to be very susceptible to stem canker in a planting at the Northeast Mississippi Branch Station at Verona.

A few of the strains were evaluated in a planting at Verona, Mississippi where stem canker was a problem. Strains which, along with Centennial, appeared to have a high level of field resistance were D79-5935, D79-6104, and D79-6162. These strains were all selections from Tracy X Centennial. D80-7987 and J80-293 were classified as moderately resistant while D79-10158, J79-454, and J80-337 were classified as being very susceptible. Seed yields for these strains were less than 50% of the seed yield for Centennial.

Strains which appear to merit further evaluation in Uniform Group VI are D79-6162, D80-7987, Ga79-402, J80-293, and R80-437. D79-5935 and D79-6104 also gave good performance, but have a background very similar to that of D79-6162.

Table 36 - Parentage of the strains in Preliminary Group VI, 1982

Strain or variety	Parentage	Generation composited

12. F77-2122	Centennial X [Forrest X (Cobb X D68-216)]	F <sub>5</sub>

Background of breeding lines used as parents:

F59-1505 is a selection from Jackson X D49-2491.

D60-7965 is a high protein selection from a cross of an F<sub>5</sub> line from Ogden X CNS with an F<sub>5</sub> line from Ogden X Biloxi.

D68-216 is a later maturing selection resistant to CN race 3 from the same cross from which Forrest was selected, Dyer X Bragg.

J74-47 is of the same parentage as Bedford.

N70-1549 is a selection from Dare X D65-6765.

J74-39 is of the same parentage as Bedford but slightly later in maturity.

D75-10169 is from Govan X an F<sub>4</sub> selection of Bragg X PI 229358, selected for resistance to foliar-feeding insects.

Uniform Group VII nurseries were planted at 30 locations. Additional plantings were made for evaluation for reaction to the two root-knot species, M. arenaria and M. incognita, and for evaluation against soybean cyst nematode race 3. An additional planting was made in a field cage at Stoneville to evaluate for reaction to foliar-feeding insects. Insufficient insects developed to obtain satisfactory readings. Results are summarized in Tables 43 through 49. Table 43 gives a general summary of seed yield, oil and protein content, general agronomic qualities, and reaction to diseases and nematodes. The planting at Jay, Florida was on soil infested with SCN race 3.

The four strains, F76-8757, D77-6103, F77-1576, and N77-940, have been evaluated three years. All have yielded well. F76-8757 has moderate resistance to both root-knot nematodes and resistance to SCN race 3. D77-6103 has resistance to races 3 and 4 of the cyst nematode and good resistance to M. incognita. F77-1576 has excellent resistance to M. incognita and appeared to be heterozygous for reaction to M. arenaria. It is resistant to SCN race 3. None of these lines appears to have sufficient merit to justify release.

The three strains, D76-9454, F77-1880, and F77-7142, have been evaluated two years. All are resistant to SCN race 3 and have good resistance to M. incognita. D76-9454 and F77-7142 also appear to have good resistance to M. arenaria. All three have yielded well.

The three strains, D79-10458, Ga78-2708, and F77-2122, were evaluated one year. D79-10458 was selected for resistance to foliar-feeding insects. It also has good resistance to M. incognita and M. arenaria and SCN race 3. It yielded quite well in the East Coast, Delta, and West Regions, but not as well as Braxton in other areas. Ga78-2708 has good resistance to both species of root-knot nematodes and to SCN race 3. F77-2122 has excellent resistance to M. incognita, a moderate reaction to M. arenaria, and is resistant to SCN race 3.

Table 43 - General summary of performance for the strains in Uniform Group VII,  
1982

	No. of locations	Braxton	Wright	F76-8757	D77-6103	F77-1576	N77-940

PRELIMINARY GROUP VII

1982

Nine Preliminary Group VII nurseries were planted which included 34 experimental strains along with Braxton and Centennial. Table 50 lists the strains along with parentage, and Table 51 gives a general summary of performance. Data for individual locations are reported in Tables 53 through 56.

Braxton had a mean seed yield of 38.2 bushels per acre. The strain having the highest average yield was La74-4656, with a mean yield of 39.9 bushels per acre. There were six strains having an average yield equal to or slightly above Braxton.

The eight 'D' lines had been selected for resistance to foliar-feeding insects. All ranked below Braxton in seed yield. However, two have good resistance to both species of root-knot nematodes and to SCN race 3. All have good resistance to M. incognita.

Eight strains appear to have a good combination of resistance to M. incognita, M. arenaria, and SCN race 3. There was a total of 13 strains resistant to SCN race 3. A total of 29 strains received low ratings for M. incognita, and 16 strains had low ratings for M. arenaria. Twelve strains received low ratings for both.

Strains which appear to merit further evaluation in Uniform Group VII are F79-4833, F80-3508, La74-4656, N80-777, and N80-2282.

UNIFORM GROUP VIII

1982

<u>Variety or strain</u>	<u>Parentage</u>	<u>Generation composited</u>
1. Hutton	F55-822 X (Roanoke X CNS-4)	F <sub>6</sub>
2. Cobb	F57-735 X D58-3358	F <sub>6</sub>
3. Foster	Centennial X [Forrest X (Cobb X D68-216)]	F <sub>5</sub>
4. N76-1507	N70-2173 X Hutton	F <sub>5</sub>
5. F77-1790	Centennial X [Forrest X (Cobb X D68-216)]	F <sub>6</sub>
6. Kirby (F77-1797)	Centennial X [Forrest X (Cobb X D68-216)]	F <sub>6</sub>
7. N77-1602	Hutton X N70-2205	F <sub>6</sub>
8. Coker 368	Co71-211 X Centennial	F <sub>5</sub>
9. F77-7450	Forrest X (Cobb X D68-216)	F <sub>5</sub>
10. Co79-760	Co73-473 X Centennial	F <sub>5</sub>
11. D79-10496	J74-39 X D75-10169	F <sub>5</sub>
12. Ga78-2488	Hutton X Ga70-276	F <sub>4</sub>

Background of breeding lines used as parents:

F55-822 is the parent line of Bragg.

F57-735 is a selection from D49-772 X Improved Pelican which was grown in Uniform Group VIII.

D58-3358 is a bacterial pustule-resistant selection from Jackson(4) X D49-2491.

D68-216 is a selection from Dyer X Bragg.

N70-2205 is a selection from Hampton X Ransom.

Co71-211 is a selection from Hampton 266 X Bragg.

Co73-473 is a selection from Hampton 266 X Bragg.

J74-39 is of the same parentage as Bedford but of later maturity.

Uniform Group VIII nurseries were planted at 19 locations. Additional plantings were made for evaluating lines for reaction to the two root-knot nematodes, Meloidogyne incognita and Meloidogyne arenaria. Plantings were also made for evaluating the strains against SCN race 3. Table 57 summarizes seed yield, general characteristics, and reaction to nematodes and diseases. Data from individual locations are summarized in Tables 58 through 63. The plantings at Jay, Florida were on soil infested with SCN race 3.

The strain F77-1797 has been released as Kirby. Kirby has resistance to the two root-knot nematodes, M. incognita and M. arenaria, along with resistance to SCN race 3. This multiple nematode resistance is a much needed combination for west Florida and south Alabama. Its three-year mean seed yield is greater than that for Hutton, Cobb, or Foster.

The strains, N76-1507, F77-1790, and N77-1602, have also been evaluated 3 years. The three-year mean seed yields are very similar to that for Kirby. However, with the release of Kirby, there does not appear to be any need for further evaluation of these strains.

The two strains, Coker 368 and F77-7450, have been evaluated two years. Both strains have yielded well, are resistant to SCN race 3 and to M. incognita, but are susceptible to M. arenaria.

The three strains, Co79-760, D79-10496, and Ga78-2488, were evaluated one year. Co79-760 yielded extremely well. D79-10496 averaged lower in yield than the check variety. All three received low ratings for M. incognita and susceptible ratings for M. arenaria. Co79-760 and D79-10496 were considered resistant to SCN race 3. D79-10496 had been selected for resistance to foliar-feeding insects.

PRELIMINARY GROUP VIII

1982

Preliminary Group VIII nurseries, which included 34 experimental strains along with Cobb and Braxton, were planted at 6 locations. Parentage of each of the strains is reported in Table 64. Table 65 summarizes seed yield, plant height, maturity, protein and oil percentages, and reaction to diseases and nematodes. Data for individual locations are reported in Tables 66 through 70. Plantings at Jay, Florida were on soil infested with SCN race 3.

Cobb had a mean seed yield of 31.3 bushels per acre. Twenty-one strains had higher mean seed yields. Six strains received low ratings for the two root-knot nematodes *M. incognita* and *M. arenaria* and also a resistant rating for SCN race 3. The five "D" lines had been selected for resistance to foliar-feeding insects. All had lower mean seed yields than the check varieties.

Strains which appear to merit further evaluation in Uniform Group VIII are Co80-917, F79-4299, F79-4589, F79-4860, F80-3602, and Ga78-1011.
