

Household Food Consumption Survey 1955

Report No. 6

# **DIETARY LEVELS of HOUSEHOLDS in the UNITED STATES**

U. S. DEPARTMENT OF AGRICULTURE

Washington, D. C.

## ACKNOWLEDGMENTS

The nationwide survey of household food consumption on which this report is based was made in April-June 1955 by the Agricultural Research Service and the Agricultural Marketing Service of the U. S. Department of Agriculture. The work was conducted in the Agricultural Research Service by the Household Economics Research Branch and in the Agricultural Marketing Service by the Market Development Branch and the Statistical and Historical Research Branch. The data were collected and tabulated by National Analysts, Inc., under contract with the Department.

The survey represents the cooperative efforts of many individuals in the Department. Faith Clark, Janet Murray, and Ennis C. Blake of the Agricultural Research Service had major responsibility for the planning and supervision of the survey, with the assistance of George R. Rockwell, Jr., Thomas

J. Lanahan, Jr., and Robert J. Lavell, of the Agricultural Marketing Service. Consultants for the Department in the design and analysis of the sample were Earl Houseman and Evelyn Grossman.

The survey was carried out under the general direction of the chiefs of the three cooperating Branches: Gertrude S. Weiss, Robert M. Walsh, and James P. Cavin.

The reports on dietary levels were prepared by the Household Economics Research Branch. In addition to staff mentioned above, Corinne LeBovit had special responsibility for these reports. The food composition data used in the calculations were prepared under the supervision of Bernice K. Watt. Among others who assisted with these reports were Eleanor Hemm and Mary Ann Moss.

# DIETARY LEVELS OF HOUSEHOLDS IN THE UNITED STATES

*Agricultural Marketing Service and Agricultural Research Service*

## HIGHLIGHTS

The average amounts of food brought into household kitchens in the United States were sufficient to provide more than recommended allowances for calories and eight nutrients studied in this survey of a week's food consumption in the spring of 1955. Not all households, however, had diets that met recommended levels. When household supplies failed to meet nutrient recommendations, they were most often short in milk, especially important for calcium, and in vitamin C-rich fruits and vegetables.

About 3 in 10 households had diets that provided less calcium than the allowances recommended by the National Research Council. About 1 in 4 had less than recommended amounts of ascorbic acid (vitamin C) and slightly smaller proportions had less vitamin A, riboflavin, and thiamine than the allowances specify. A tenth or fewer had food furnishing less than recommended amounts of iron, protein, and niacin.

This does not prove that all of those families were poorly fed or subject to malnutrition; the recommended allowances provide a considerable margin of safety over average needs. This margin varies for the different nutrients. About 90 percent of the households had food that provided at least two-thirds of the recommended amounts of ascorbic acid and calcium and the diets of an even higher percentage furnished at least two-thirds of the allowances for other nutrients.

Data in this report show amounts of nutrients in the food that came into household kitchens for consumption. How much food was discarded either as plate waste or during or after preparation was not reported. Hence amounts of nutrients in the food actually eaten may be smaller than the amounts shown in the tables of this publication. Losses in terms of calories may be especially high.

### COMPARISON WITH EARLIER SURVEYS

Diets in this country as a whole have shown considerable improvement since the large-scale survey in 1936 when a third of the diets were classed as "poor." Today in probably as few as 10 percent of the Nation's households can the diets be called "poor" by the standards used in the earlier period.

Of the nutrients for which calculations have been made, three B-vitamins--thiamine, niacin, and riboflavin--and iron showed the greatest increase since 1936. These substances are added to grain products as enrichment ingredients

and some of them, especially niacin and riboflavin, have also been increased by greater consumption of meat and milk. The calcium and protein content of diets has also increased considerably as a result of increases in milk and meat consumption.

Relatively little improvement in urban dietary levels has taken place since 1948 when a food consumption survey of urban families of two or more persons was made. In 1955 approximately the same proportions of urban household diets as in 1948 failed to furnish recommended amounts of calcium, vitamin A, thiamine, and riboflavin--nutrients that often are in shorter than desirable supply in diets. Some improvement in protein, iron, and niacin levels has occurred, owing largely to the greater consumption of meat, poultry, and fish. There was some lowering of ascorbic acid levels, chiefly because of a shift in the pattern of household consumption of fruits and vegetables.

The improvements in diets in the past two decades have been the result of a combination of factors. We have enjoyed economic conditions under which an increasing proportion of people have been able to have the kinds of food they want. Average real income (income after adjustment for increases in price) is higher, and the benefits of increased incomes have especially affected families at the lower end of the income distribution. And finally, people are more generally aware of their need for a proper assortment of foods for good health.

### RURAL-URBAN DIFFERENCES

Though rural-urban differences in food consumption patterns have become less marked over the last 20 years, considerable differences in dietary levels still exist. In the spring of 1955 farm diets provided more of all nutrients except ascorbic acid and vitamin A, even when differences in household size (i.e., the number of persons served at home) were accounted for. When differences in the composition of the household (i.e., the age and sex of members though not the activity of the members in this survey) are taken into account, most of the differences are minimized though still significant.

Urban diets provided more vitamin A and ascorbic acid than farm diets because of larger quantities of dark-green and deep-yellow vegetables (for vitamin A) and citrus fruit (for ascorbic acid). Only 67 percent of the farm households had at least one dark-green or deep-yellow vegetable during the survey week compared with 82 percent of the urban households. Comparable proportions for citrus fruits were 69 percent and 87 percent.

The larger number of calories from the farm diets was the result of larger quantities per person of milk, grain products, fats and oils, and sugars. The higher milk consumption also meant more calcium and riboflavin and contributed to the higher amounts of protein and thiamine.

Among farm households, home-produced food contributed at least 30 percent of the total quantities of the nutrients for which calculations were made, with the proportion rising to about 50 percent for vitamin A, calcium, and riboflavin. About one-third of the total vitamin A value of farm diets was supplied by green and yellow vegetables, including sweetpotatoes. One-half of these vegetables were grown at home. Calcium and riboflavin were supplied chiefly by milk, a large proportion of which was home-produced (68 percent). Milk also is an economical source of protein. Urban households spent 14 percent of their total food dollars for milk in its several forms, including cream, cheese, and ice cream, and yet obtained 22 percent of their total protein from these foods.

#### DIFFERENCES BY INCOME

Considerable variation in food consumption patterns was found when families were classified by money income, as would be expected. Differences in types of foods used were usually greater, however, than differences in the amounts of nutrients provided.

For income comparisons it is desirable to consider one urbanization group at a time since there are relatively more farm families in the lower money income classes and more urban families in the upper income classes. Even for separate urbanization groups, differences in food consumption among income classes probably should not be attributed entirely to income differences. They are likely to reflect also differences among households in race, nationality and regional background, education, size, and other characteristics.

In any event households with higher money incomes spent considerably more for food than the lower income households. For example, urban households with family incomes between \$6,000 and \$8,000 averaged \$31 per household or \$9.00 per person for food used at home in the week, with 12 percent spending under \$6.00 per person and 20 percent over \$12.00. Households with incomes between \$2,000 and \$3,000 averaged \$21 per household or \$6.50 per person, with 40 percent spending less than \$6.00 and 7 percent more than \$12.00.

In farm, rural nonfarm, and urban groups the number of calories in food brought into household kitchens varied little with the family income. Amounts of ascorbic acid rose sharply with income. The "income elasticity" of this nutrient is closely associated with the relatively high income elasticity of fresh fruits and fruit juices, rich sources of this vitamin.

In farm diets most nutrients other than ascorbic acid were little affected by income. Vitamin A was the only other nutrient that increased with income. It is likely that in the spring, when gardens are not yet producing much and stocks of canned and frozen foods from the previous year are likely to be

depleted, the farm family must buy much of the fruit and vegetables that furnish these two vitamins. Farm families with higher money incomes bought more of these ascorbic acid- and vitamin A-rich foods.

In both the rural nonfarm and urban groups the diets of higher income families contained larger quantities of nearly all nutrients than did those of the lower income groups. The differences were particularly marked between the low- and the middle-income groups.

#### ONE-PERSON HOUSEHOLDS

Almost three-fourths of the one-person households lived in cities and half were women 55 years of age or over. Nutrient averages for this group were high--20 percent or more above those of households of two or more persons for many nutrients (probably an indication of considerable waste). Nevertheless, the proportion of one-person households with diets that met the recommended allowances of the National Research Council was no greater than that of the entire group of families; in fact, the proportion that met allowances for protein and iron was lower.

#### FAT IN DIETS

Because of current interest in the relation of the kind and amount of dietary fat to cardiovascular diseases, the fat in the food brought into household kitchens has been calculated. An average of 155 grams of fat per day was available for consumption. The amount was somewhat higher in farm diets than in nonfarm, 170 grams and 153 grams, respectively. It should be noted however that no deductions have been made in the survey for food discarded. Such discards probably include relatively large amounts of fat, but this survey provided no basis for quantitative estimates.

The share of the calories that came from fat was 44 percent; 13 percent came from protein, and the remaining 43 percent from carbohydrate. Rural-urban differences in these proportions were not large because although rural diets provided more fat, they also provided more protein and carbohydrate.

The proportion of calories from fat in urban diets, 45 percent, was larger than was found in the 1948 survey, 42 percent. The increase was due to the greater consumption of meat, poultry, and fish and the smaller consumption of high-carbohydrate foods such as grain products in the later year. Slightly more than one-fourth of the dietary fat in household food supplies in 1955 came from the meat, poultry, and fish group.

The shift toward a higher proportion of fat in household food supplies is even more marked between 1936 and 1955. In the survey made in the earlier period, only 38 percent of the calories in the food of all households (urban and rural) was provided by fat, compared with 44 percent in the 1955 survey. This trend is substantiated by estimates based on per capita food consumption derived from statistics on production, stocks, and utilization. Whether the shift in the source of our calories--more from fat, less from carbohydrate--is or is not desirable nutritionally is a subject needing more research.

## INTRODUCTION

This report on the nutritive content of diets contains a portion of the data from the U. S. Department of Agriculture's nationwide Survey of Household Food Consumption made in the spring of 1955. Previous reports in this series have presented the data on quantities of foods used during the week, which are the basis of calculations of nutrient content of household food supplies in this report.

Periodic examinations of food consumption of population groups are needed for many purposes--for administration of public programs affecting food supply, distribution, and consumption; for educational programs to improve food habits; and for private efforts to broaden and improve the marketing of foods. Nationwide surveys of food consumption of urban and rural households were made in 1936 and 1942 and of urban families in 1948. No surveys of rural families have been made since 1942 except on a regional basis.<sup>1</sup>

The 1955 survey is the most comprehensive yet undertaken. Like the earlier surveys, its objectives were to obtain current information on patterns on food consumption, expenditures, dietary levels, and household food practices. Households were grouped (1) by region--Northeast, North Central, South, and West (Census of Population regions, see map, p. 4); (2) by urbanization--rural farm, rural nonfarm, and urban within regions; and (3) by several family income classes within region-urbanization categories.

Because of the widespread demand for current data on food consumption patterns and dietary levels, the statistical data contained in this report are being issued immediately after tabulation, accompanied by a minimum of descriptive information and only a short summary of highlights. In this way, public and private research organizations may proceed with analysis of the data for their own use at the same time that studies are being carried on by research groups within the Department of Agriculture.

The survey was based on a national probability sample of approximately 6,000 housekeeping households of one or more persons. Housekeeping households were defined as those in which at least one member had 10 or more meals from home food supplies during the week preceding the interview. Institutions and persons living on military reservations were not represented.

Collection of the data, made during April, May, and June of 1955, was by personal interview with household members, usually the homemaker. Information was obtained on the number of meals eaten at home and away from home by each individual in the household, the expenditures for food eaten away from home, quantities of all food items used at home during the 7 days preceding the interview and the expenditures for the purchased items, selected household food practices during the previous year, and various family characteristics such as income needed for classification of the data.

The basic data in this survey relate to quantities of food consumed, or food used up, during a week. The only exceptions are the figures for certain miscellaneous food items and tea and alcoholic beverages which relate to purchases made during the week rather than to consumption. For these commodities, purchases usually can be reported more readily than consumption. For an individual family there may be a substantial difference between purchases and consumption of a food during a week. Some of the food used may have been purchased earlier and some of the food purchased during the week may not have been consumed until later. For a large group of families, however, average purchases of a food tend to equal average consumption. For this reason, comparisons generally can be made between this survey and other large surveys where food purchases rather than food consumption are measured.

Nutrients in the food reported used during the week were calculated from tables of food composition, chiefly those in Agriculture Handbook No. 8, "Composition of Foods...Raw, Processed, Prepared." Alcoholic beverages were not included in the calculations. Nutrient quantities in this report, as in most reports of household food consumption surveys, are those available at the "kitchen level." Because of losses of food in preparation and serving, amounts of nutrients, especially food energy (calories), in food actually eaten may be considerably below the levels shown here. Quantitative information on food losses in households is extremely meager.

To assure adequate farm coverage the sample included, in addition to a basic cross-section of about 4,500 urban, rural nonfarm, and rural farm households, a supplemental sample of about 1,500 farm-operator households. Hence it was necessary in combining the data for rural farm and the other urbanizations to use appropriate weights in order to obtain the "all-urbanization" averages. A more detailed description of the sample design and its appraisal are presented in Reports 1 to 5 of this series.

In requesting the information from households, trained interviewers used a detailed food list to help respondents recall the quantities of foods used during the week and the amounts paid for purchased items. (This method is sometimes referred to as the "recall-list method.") Since the success of surveys of this type depends in large part on the interviewers' skill in drawing out the necessary information from the person interviewed, considerable care was taken in the selection and training of the interviewers. At training schools lasting from 3 to 5 days, instructions and practice were given in the sampling phase of the survey, in interviewing, and in recording in correct form on the schedule. Manuals of instruction, prepared by the contractor and reviewed by the USDA staff, were used in training schools and served as reference tools for interviewers during the collection period.

A glossary on page 65 explains the major terms used in this study.

## NOTES ON USE OF TABLES

Table 1 presents the counts of households in the survey and the average size of the household in equivalent persons and in equivalent nutrition units. (See Glossary, Household size and Equivalent nutrition unit.)

Table 2 presents the distribution of persons in specified sex and age groups based on the number of meals served at home in a week.

The average nutritive value of the food brought into household kitchens is shown in tables 3 to 5. (See Glossary, Food used at home and Nutritive value of diets.)

Table 6 compares the division of the household food dollar and the contribution of food groups to the nutritive value of diets. Such a comparison can be the basis for information on the relative economy of foods as sources of nutrients.

Tables 7 to 11 show the distribution of households using food at home that furnished specified quantities of each nutrient. For these tables the nutrient content of household diets was calculated for each household separately. Table 12 summarizes the percentage of households using food at home that did not furnish recommended amounts of 8 nutrients. The recommended amounts are based on the recommended dietary allowances of the National Research Council. (See Glossary, Recommended dietary allowances.)

Tables 13 to 15 present the basic data on food consumed (i.e., food as measured at the kitchen level and not necessarily all eaten). Data shown in this report are the same as those shown in the corresponding report on household food consumption (Reports 1 to 5 in this series) but fewer individual items are shown here and the groupings are somewhat different. Groupings used in this and the other reports on dietary levels in this series take account of nutritional characteristics of foods rather than, as in Reports 1 to 5, the form in which they appear in the retail market.

Averages in tables 13 to 15 are based on all households in the cell (table 1) whether or not they used the specified food. However, since the percentage

of households using the food is shown, averages for these households only can be obtained by dividing the average for all households in the cell by the percentage using.

Where per person averages for groups of households are needed, they may be computed by dividing the household quantities by the average household size (number of "21-meal-at-home equivalent" persons in the household, table 1, column 3). The use of the number of 21-meal-at-home equivalent persons for computing averages per person is an attempt to adjust for the fact that the number of persons in the family is not always identical with the number of persons eating from household (home) food supplies. Some family members may have eaten meals away from home and nonfamily members (guests, hired help, boarders) may have eaten from the respondent's household food supplies. This method has the limitation of assigning equal weight in quantity and cost to all meals (morning, noon, and evening), and makes no allowance for any difference between amounts or kinds of food at meals eaten away and those served at home.

Tables 16 to 18 present data on the total money value of food (expense and value of home-produced food separately for farm households) used at home per household and per person (21-meal-at-home equivalent person) and the distribution of households having food of specified money value per person. These tables thus give some measure of the variation among households in food consumption.

In all tables where combinations for groups of households are needed, they may be computed by using the counts of households shown in table 1, column 2. In making combinations, the appropriate adjustments for oversampling of the rural farm households must be made. For example, in combining income classes for "all urbanizations," the column showing the weighted counts (2a), where this adjustment has already been made, should be used. In combining rural farm and rural nonfarm into a single rural group, the full count of rural nonfarm, but only one-fourth of rural farm households (column 2a) should be used.

Milk, cream, ice cream, cheese; meat, poultry, fish, eggs, dry legumes, nuts: Percentage of households using at home in a week and average quantity and average money value per household; food from all sources and home-produced food separately for farm households, by income..... | 42   |
| 4. Nutritive value of diets per nutrition unit: Average per nutrition unit per day from food used at home; food from all sources and home-produced food separately for farm households, by income.....                                                                   | 16   | 14. Vegetables and fruits: Percentage of households using specified kinds at home in a week and average quantity and average money value per household; food from all sources and home-produced food separately for farm households, by income.....                                        | 48   |
| 5. Nutritive value of diets of food group: Average per nutrition unit (of fat, per person) per day from food used at home; food from all sources and home-produced food separately for farm households.....                                                              | 18   | 15. Grain products; fats and oils; sugars and sweets; miscellaneous foods: Percentage of households using at home in a week and average quantity and average money value per household; food from all sources and home-produced food separately for farm households, by income.....        | 54   |
| 6. Division of household food dollar and contribution of food groups to nutritive value of diets: Percentage of total money value and of total nutritive value from foods used at home: food from all sources and home-produced food separately for farm households..... | 24   | 16. Money value of all food used at home: Average per household and per person and distribution of households by money value per person of all food used at home in a week, by income.....                                                                                                 | 60   |
| 7. Food energy, fat: Distribution of households using food at home in a week that furnished specified quantities of food energy per nutrition unit per day and of fat per 100 calories, by income.....                                                                   | 30   | 17. Expense for purchased food at home: Average per household and per person and distribution of households by expense per person for purchased food used at home in a week, by income.....                                                                                                | 62   |
| 8. Protein, calcium: Distribution of households using food at home in a week that furnished specified quantities of protein and of calcium per nutrition unit per day, by income.....                                                                                    | 32   | 18. Money value of home-produced food: Average per household and per person and distribution of households by money value per person of home-produced food used at home in a week, by income.....                                                                                          | 62   |
| 9. Iron, vitamin A value: Distribution of households using food at home in a week that furnished specified quantities of iron and of vitamin A value per nutrition unit per day, by income.....                                                                          | 34   | 19. Iodized salt: Households using iodized and noniodized salt at home in a week, by income.....                                                                                                                                                                                           | 63   |
| 10. Thiamine, riboflavin: Distribution of households using food at home in a week that furnished specified quantities of thiamine and of riboflavin per nutrition unit per day, by income.....                                                                           | 36   |                                                                                                                                                                                                                                                                                            |      |

Table 1.--NUMBER OF HOUSEHOLDS AND HOUSEHOLD SIZE

UNITED STATES

BY URBANIZATION

Number of households and average household size in equivalent persons and in equivalent nutrition units, based on number of meals served in a week, April-June 1955; housekeeping households of 1 or more persons, by income

| Urbanization, household size group,<br>and money income after income taxes<br>for households of 2 or more persons<br>(dollars) | Households <sup>1/</sup>          |                                     | Household size                                         |                                          |                                            |         |                        |

1/ The sample contains 4 times as many rural farm schedules as are required to provide proportionate representation of all groups. "All urbanizations" is shown both with and without extra schedules. The effective sample size (i.e. the size a self-weighting sample would have to be to yield the same standard error as the existing sample), which would be used for judging reliability of the tabulated data, is somewhere between the two. The total including all farm schedules is the correct estimate of the effective sample when the standard deviation of the nonfarm data is 1/2 that of the farm. The total including 1/4 of the farm schedules collected is more nearly correct when the standard deviation of the nonfarm data is 1-1/2 that of the farm. Limited evidence from previous studies suggests that this ratio is less than 1 for most items.

2/ See Glossary, Nutrition units.

3/ Households with primary economic family of 1 person.

4/ Households with primary economic family of 2 or more persons and with no economic family during the week preceding the interview and/or in 1954.

5/ The major part of the "not classified" comprises families unwilling or unable to report their income; includes also the few households with no economic family during the week preceding the interview and/or in 1954.

6/ Includes a few urban farm families.

Note: Component items may not add to totals because of rounding.

Table 2.--HOUSEHOLD COMPOSITION

UNITED STATES

ALL URBANIZATIONS

Distribution of persons in specified sex and age groups, based on meals served at home in a week, April-June 1955; housekeeping households of 1 or more persons, by income

| Household size group, and money income<br>after income taxes for households of 2<br>or more persons (dollars) | Total<br>(cols. 3, 8, 13) | Men                  |                |                |                |                      | Women                 |                |                |                |                      |

Table 5.--NUTRITIVE VALUE OF DIETS BY FOOD GROUP (continued)

UNITED STATES

NONFARM (URBAN AND RURAL NONFARM)

Average per nutrition unit (of fat, per person) per day from food used at home in a week, April-June 1955; food from all sources and home-produced food (valued at average prices paid for purchased food) separately for farm households; housekeeping households of 1 or more persons

| Food group                                          | Food energy | Protein | Fat   | Calcium | Iron | Vitamin A value | Thiamine $\frac{1}{1}$ | Riboflavin $\frac{1}{1}$ | Niacin $\frac{1}{1}$ | Ascorbic acid $\frac{1}{1}$ |
|-----------------------------------------------------|-------------|---------|-------|---------|------|-----------------|------------------------|--------------------------|----------------------|-----------------------------|

Table 5.--NUTRITIVE VALUE OF DIETS BY FOOD GROUP (continued)

UNITED STATES

RURAL FARM

Home-produced food

Average per nutrition unit (of fat, per person) per day from food used at home in a week, April-June 1955; food from all sources and home-produced food (valued at average prices paid for purchased food) separately for farm households; housekeeping households of 1 or more persons

| Food group                                 | Food energy | Protein | Fat  | Calcium | Iron | Vitamin A value | Thiamine <u>1/</u> | Riboflavin <u>1/</u> | Niacin <u>1/</u> | Ascorbic acid <u>1/</u> |

\* Less than 0.5 calories, milligrams of calcium or ascorbic acid and I.U. of vitamin A value, 0.05 grams of protein or fat, milligrams of iron or niacin, 0.005 milligrams of thiamine or riboflavin.

1/ Cooking losses deducted.

2/ Spinach and other dark, leafy greens, broccoli, green peppers, carrots, pumpkin, winter squash, etc.

3/ Green lima and snap beans, green peas, asparagus, cabbage, lettuce, okra, etc.

4/ Includes all ingredients of purchased baked goods and of flour mixtures and soup, chiefly grain.

5/ Includes all ingredients of jellies, jams, and preserves, and of prepared desserts such as puddings and gelatin desserts.

6/ Includes yeast, plain chocolate, cocoa.

Table 6.--DIVISION OF HOUSEHOLD FOOD DOLLAR AND CONTRIBUTION  
OF FOOD GROUPS TO NUTRITIVE VALUE OF DIETS

UNITED STATES

ALL URBANIZATIONS

Percentage of total money value of and of total nutritive value from foods used at home in a week, April-June 1955; food from all sources and home-produced food (valued at average prices paid for purchased food) separately for farm households; housekeeping households of 1 or more persons

\* Less than 0.05 percent.

1/ Cooking losses deducted.

2/ Spinach and other dark, leafy greens, broccoli, green peppers, carrots, pumpkin, winter squash, etc.

3/ Green lima and snap beans, green peas, asparagus, cabbage, lettuce, okra, etc.

4/ Includes all ingredients of purchased baked goods and of flour mixtures and soup, chiefly grain.

5/ Includes all ingredients of jellies, jams, and preserves, and of prepared desserts such as puddings and gelatin desserts.

6/ Includes yeast, plain chocolate, cocoa.

7/ Includes such items as alcoholic beverages, coffee, tea, baking powder, condiments, for which no nutritive values were calculated.

Percentages may not add to totals because of rounding.

Table 7.--FOOD ENERGY, FAT

UNITED STATES

BY URBANIZATION

Distribution of households using food at home in a week, April-June 1955, that furnished specified quantities of food energy per nutrition unit per day and of fat per 100 calories (percentages based on all households in cell appropriately weighted for farm and nonfarm combinations, table 1, column 2); housekeeping households of 1 or more persons, by income

Table 8.--PROTEIN, CALCIUM

UNITED STATES

BY URBANIZATION

Distribution of households using food at home in a week, April-June 1955, that furnished specified quantities of protein and of calcium per nutrition unit per day (percentages based on all households in cell appropriately weighted for farm and nonfarm combinations, table 1, column 2); housekeeping households of 1 or more persons, by income

\* Less than 0.05 percent, 0.005 pounds, or 0.005 dollars.

\*\* Data not available.

1/ Includes the dry weight of flour and cereal in prepared products and baked goods.

2/ Includes the sugar equivalent of soft drinks, beverage and dessert powders, and prepared desserts.

3/ Includes yeast, plain chocolate, cocoa.

4/ Includes such items as alcoholic beverages, coffee, tea, baking powder, condiments, for which no nutritive values were calculated. Data (except for coffee and tea) refer to amounts bought during the 7-day period rather than the amounts used.

Table 16.--MONEY VALUE OF ALL FOOD USED AT HOME

UNITED STATES

BY URBANIZATION

Average per household and per person and distribution of households by money value per person of all food used at home in a week, April-June 1955 (based on all households in cell appropriately weighted for farm and nonfarm combinations, table 1, column 2); housekeeping households of 1 or more persons, by income

\* Less than 0.05 percent.

Percentages may not add to totals because of rounding.

1/ Two percent of households not reporting on iodization or on use of salt, or reporting no salt used were excluded from the base.

## GLOSSARY

### COOKING LOSSES

See "Nutritive value of diets."

### EQUIVALENT NUTRITION UNIT

The equivalent of an adult male in terms of allowances for a specified nutrient. Computed in this study for each of 9 nutrients for evaluating dietary levels of households of different size and composition. (Numerically, several nutrients had similar values; hence, only four sets of equivalent nutrition units were used in the calculations. See table 1.) The number of nutrition units in a household for a given nutrient tells how many times the amount recommended for an adult male 25 years of age is needed by that household to meet recommended allowances for the nutrient. (See Glossary, Recommended dietary allowances.)

The procedure used for computing nutrition units (or adult-male equivalents) was as follows: First, the NRC allowances for a particular nutrient for persons in each sex and age group shown in table 2 were expressed as relatives, using the allowance for the young adult male as 1.0. For each household these relatives were then multiplied by the number of persons (21-meal-at-home equivalents) in the appropriate sex-age group. The sum of these products is the number of nutrition units or adult-male equivalents represented by the household in requirements for the given nutrient.

### FAMILY, ECONOMIC

Defined for purposes of this study as a person living alone or a group of persons who lived together and drew from a common fund for their major items of expense. All unmarried sons and daughters who lived at home were considered part of the economic family. Other persons, related or unrelated, who lived with the family, were considered members of the economic family if they drew from the common family fund for food, housing, and automobile expenses and, in addition, for at least one other category of major expense such as clothing or medical care, or if they pooled savings with the family's. Family members who were temporarily away from home—at school, at work, or on vacation—were considered members of the economic family, although not residing in the dwelling unit at the time of the interview.

### FAMILY, ECONOMIC, PRIMARY

There may have been more than one economic family in a household unit. If so, the one that was more closely connected with maintaining the dwelling unit was the "primary" one.

### FAMILY, ECONOMIC, SECONDARY

If two or more economic families were present in a household, members of the one not considered primary (see above) were considered in the same way as boarders and hired help, i.e., they were counted in terms of 21-meal equivalents in computing household size but information on their expenses for food away from home and their income was not requested.

### FARM

Defined as in the United States Census of Agriculture, 1950. Places of three or more acres were counted as farms if the value of agricultural products raised on them in 1954, exclusive of home gardens, amounted to \$150 or more. The agricultural products could have been either for home use or for sale. Places of less than 3 acres were counted as farms only if the value of sales of agricultural products in 1954 amounted to \$150 or more.

### FARM HOUSEHOLD

A household that included a farm operator. See "Farm" and "Farm operator." Those few farm households that lived in urban places were tabulated as urban schedules.

### FARM OPERATOR

Defined as in the United States Census of Agriculture, 1950, i.e., a person who was responsible for the operation of farm land. He may have performed the labor himself or directly supervised it; he may have been either an individual operator or one of a group of individuals acting as partners. Control may have been through ownership, or through lease, rental, or cropping arrangement. An operator was distinguished by the decision-making function. A hired manager was considered an operator inasmuch as he was hired to make decisions and normally to do farm work. A farm laborer who worked for wages and did not make decisions was not considered a farm operator. A person who rented land to others, receiving a share of the product or cash for use of the land, was considered a landlord and not a farm operator.

### FOOD FROM ALL SOURCES

Food purchased, home-produced, and received as gift or pay.

### FOOD HOME-PRODUCED

Includes foods raised for home use and those obtained by hunting, fishing, and collecting wild fruit and nuts. Excludes home-canned, home-frozen, and home-baked foods that were prepared from purchased ingredients. Quantities were valued at average prices paid by households of the same urbanization-region group for similar items.

### FOOD OBTAINED WITHOUT DIRECT EXPENSE

Includes foods raised for home use and those obtained by hunting, fishing, and collecting wild fruit and nuts, or food received as a gift or as payment for services rendered. Quantities were valued at average prices paid by households of the same urbanization-region group for similar items.

### FOOD USED AT HOME

Food "used" means food used in an economic sense (rather than food ingested) and includes food eaten, thrown away as waste, or fed to pets. (Dog or cat food, i.e., food not bought for human consumption, is not included.)

Purchased food as well as food that was home-produced or received as a gift or payment for goods or services is included. Food "used" covers that served at home to family members (primary and secondary), hired help, boarders, or guests, or food carried from home in packed meals.

If food was prepared but not used up during the survey week (7 days preceding interview), it was not recorded. If, however, a portion of a home-prepared dish, such as a cake, was used up during the period, an estimate of that portion of each of its ingredients was reported. Also, the homemaker was reminded to include that portion of food prepared before the period covered that was used during the survey week. Food that was canned at home during the survey week was not listed except for that quantity served during the week.

Food that was given away, for example given to neighbors or donated to church suppers, was not recorded.

Foods were generally entered on the schedule in the form in which they were brought into the kitchen. For many mixed dishes, this was not necessarily the form in which they were eaten. For example, flour that was used to make bread or cake at home appeared on the schedule as flour, but purchased baked goods were entered as bread or cake. In the same way, foods such as eggs, fat, sugar, and milk that came into the kitchen in ice cream, canned fruits, baked goods, or soft drinks were reported in those categories.

Vegetables and fruits that were canned or frozen at home were tabulated as fresh—either purchased, home-produced, or received as gift or pay as was the case. Only commercially packed products were included in tabulations of canned and frozen fruits and vegetables (contrary to practice in the earlier surveys). On the other hand homemade jams and jellies, home-canned soups and tomato or other vegetable juices, and homemade pickles and relishes were included with the commercially prepared items. Where separate data are shown for purchased or home-produced items, the designation refers to the source of the chief ingredient.

#### HOUSEHOLD

Group of persons who shared family food supplies. Includes members of primary and secondary families, guests, boarders, household help, and farm help. A household need not have included an economic family. Two or more girls, for example, sharing an apartment may have been a household yet did not constitute an economic family.

#### HOUSEHOLD, ELIGIBLE FOR SURVEY

One in which at least one person had 10 or more meals from household food supplies during the preceding 7 days.

#### HOUSEHOLD SIZE

The total number of meals served to all persons in the household from family food supplies was divided by 21 to obtain the household size in equivalent persons. (The procedure for obtaining household size in equivalent nutrition units is explained under "Equivalent nutrition unit.") The count of

equivalent persons was not reduced in those households where family members omitted meals nor was it increased for between-meal snacks or additional meals, such as those served to invalids or young children.

Lunches carried from home and supplemented by purchased food were considered one-half meals; those supplemented by beverages only were counted as full meals. Refreshments served to members of the household were not counted as meals unless they served as substitutes for regular meals. Refreshments served to guests were counted according to the number of meals which they approximated.

#### MONEY INCOME, AFTER INCOME TAXES

Money income, after deduction of State and Federal income taxes, of all persons who were members of the primary economic family during all or any part of 1954. Income included wages and salaries paid to family members, net income from self-employment including farming, from real estate, and from boarders; interest, dividends, and mineral rights; pensions, annuities, allotments, contributions, relief payments, social security; unemployment insurance payments; and gross receipts from roomers. Excluded were lump-sum payments of inheritances and insurance policies. Farm income was the total of all farm receipts during the year (after payment of share rent to others) minus farm operating expenses. Farm operating expenses did not include purchase of land, depreciation or purchase of machinery or building improvements. Net change in inventories of livestock or crops was not counted as income.

Some households were not classified by income, either because they did not contain an economic family during the week of the survey or for the year 1954 or because they were unable or unwilling to give the information regarding income.

#### NOT CLASSIFIED BY INCOME

Households that were not economic families for the week of the survey or for the year 1954 and households that were unable or unwilling to give information about income.

#### NUTRITION UNIT

See "Equivalent nutrition unit."

#### NUTRITIVE VALUE OF DIETS

Nutrients in the food reported used were calculated chiefly from table 2 of Agriculture Handbook No. 8, "Composition of Foods—Raw, Processed, Prepared." This table shows quantities of nutrients obtained in the edible portions of foods purchased in generally good condition and makes allowance for inedible portions such as bone, pits, shells. For a large number of items the values in this table were revised in accordance with newer data on yields from Agriculture Handbook No. 102, "Food Yields—Summarized by Different Stages of Preparation." For retail food supplies in the forms currently marketed, with a normal amount of wilt, spoilage, and other types of loss, these newer data were considered more suitable than the yield figures based on the earlier

publication. Values for foods not included in Handbook 8 were unpublished data from the files of the Department's Food Composition Unit, Household Economics Research Branch.

For this survey, estimated average losses in cooking for thiamine, riboflavin, niacin, and ascorbic acid were deducted from the composition values before these were applied to the food quantities. Loss factors used were developed for groups of foods and were based on experimental data with consideration given to usual cooking practices in the United States.

How much food was discarded either as plate waste or during or after preparation was not reported. Hence amounts of nutrients in the food actually eaten may be smaller than the amounts shown in the tables of this publication.

The nutritive content was calculated only for foods. No estimate was made of the minerals in the local water or in baking powder, for calories in alcoholic beverages, or for any vitamin or mineral supplements.

#### RECOMMENDED DIETARY ALLOWANCES

Levels of nutrient intake that the Food and Nutrition Board of the National Research Council recommends as normally desirable goals or objectives towards which to aim in planning practical dietaries, sometimes referred to in this report as NRC allowances or NRC levels (Recommended Dietary Allowances. Food and Nutrition Board. Natl. Res. Council Pub. 302, rev. 1953). For this report the 1953 allowances were used as modified for application to dietary surveys by C. LeBovit and H. K. Stiebeling in "Applying 1953 Dietary Allowances to U. S. Population Groups" (Amer. Dietet. Assoc. Jour. 33: 219-224, 1957).

#### REGION

The Census of Population classification was used. The States in each of the regions are as follows:

##### *Northeast*

|               |               |              |
|---------------|---------------|--------------|
| Connecticut   | New Hampshire | Pennsylvania |
| Maine         | New Jersey    | Rhode Island |
| Massachusetts | New York      | Vermont      |

##### *North Central*

|          |           |              |
|----------|-----------|--------------|
| Illinois | Michigan  | North Dakota |
| Indiana  | Minnesota | Ohio         |
| Iowa     | Missouri  | South Dakota |
| Kansas   | Nebraska  | Wisconsin    |

##### *South*

|                      |                |                |
|----------------------|----------------|----------------|
| Alabama              | Kentucky       | South Carolina |
| Arkansas             | Louisiana      | Tennessee      |
| Delaware             | Maryland       | Texas          |
| District of Columbia | Mississippi    | Virginia       |
| Florida              | North Carolina | West Virginia  |
| Georgia              | Oklahoma       |                |

##### *West*

|            |            |            |
|------------|------------|------------|
| Arizona    | Montana    | Utah       |
| California | Nevada     | Washington |
| Colorado   | New Mexico | Wyoming    |
| Idaho      | Oregon     |            |

#### URBANIZATION

Census of Agriculture definitions of urban, rural nonfarm, and rural farm were used. Urban households lived in communities of 2,500 or more persons or in the fringe areas around cities of 50,000 or more. Farm households were those that included a farm operator, a person responsible for the operation of a farm, either performing the labor himself or directly supervising it. A farm was defined as in the U. S. Census of Agriculture, i.e. a place of 3 or more acres with value of farm products raised (for sale or for home use), exclusive of home gardens, amounting to \$150 or more in 1954 or a place of less than 3 acres with value of sales of agricultural products amounting to \$150 or more. See "Farm" and "Farm operator." Those few farm households that lived in urban places were tabulated as urban schedules. Rural nonfarm households were those living outside of urban places that were not classified as rural farm.

## SELECTED PUBLICATIONS FROM OTHER SURVEYS OF FAMILY FOOD CONSUMPTION AND DIETARY LEVELS\*

Diets of families of employed wage earners and clerical workers in cities. (1934-37 data.) H. K. Stiebeling and E. F. Phipard. U. S. Dept. Agr. Cir. 507, 141 pp., illus., 1939

Family food consumption and dietary levels. Consumer Purchases Study. (Farm Series.) Five Regions. (1935-36 data.) H. K. Stiebeling, D. Monroe, C. M. Coons, and others. U. S. Dept. Agr. Misc. Pub. 405, 393 pp., illus., 1941

Family food consumption and dietary levels. Consumer Purchases Study. (Urban and Village Series.) Five Regions. (1935-36 data.) H. K. Stiebeling, D. Monroe, E. F. Phipard, and others. U. S. Dept. Agr. Misc. Pub. 452, 268 pp., illus., 1941

Family food consumption in the United States, spring 1942. U. S. Bureau of Human Nutrition and Home Economics. U. S. Dept. Agr. Misc. Pub. 550, 157 pp., 1944

Diets of families in the open country--a Georgia and an Ohio county, summer 1945. S. F. Adelson and E. C. Blake. U. S. Dept. Agr. Misc. Pub. 704, 90 pp., illus., 1950
