The Nationwide Food Consumption Survey (NFCS), 1977-78

BACKGROUND: The NFCS 1977-78 provided information on food consumption at two levels:

0 Food used by entire households at home (household use of food component) The basic sample was a nationally representative sample of households in the 48 conterminous States and Washington DC. Information on household food use and money value of food was collected using a 7-day list recall from the person with major responsibility for planning or preparing meals. The interviewer asked which foods from a list were used, and the respondent indicated the kind, amount, source (purchased, home produced, gift or pay), and the price if purchased. Foods were analyzed for food energy and 14 nutrients. Other information included the sex and age of each household member; the number of morning, noon, and evening meals each had during the week from home food supplies and away from home; and the expense for meals and snacks bought away from home. In addition, counts of guest meals and snacks were recorded, because the affect household food use.

Data for the 1977-78 basic survey were collected from Apr. 1977 - Mar. 1978. The survey included several supplemental samples: Households containing one or more elderly persons (April. 1977 - Mar. 1978), households in Puerto Rico (Jul. 1977 - Dec. 1977), Alaska (Jan.-Mar. 1978), and Hawaii (Jan.-Mar. 1978), and households eligible for the Food Stamp Program (low-income I) in Nov. 1977 - Mar. 1978. A follow-up low-income survey was conducted in 1979-80 (low-income II) in Nov. 1979 - Mar. 1980. For the 1977-78 low-income sample, eligible households were those receiving food stamps or eligible to receive food stamps; information for the second low-income sample was collected to reflect changes in the food stamp program.

0 Foods eaten at home and away from home by individual household members (individual intake component). In this component, the sample included a nationally representative sample of about 36,000 individuals in households in the 48 conterminous States and Washington DC. Food intake was collected over 3 consecutive days using a 1-day dietary recall in an in-person interview and a self-administered 2-day dietary record. Each respondent provided information on his or her own intake, except for children under 12 years of age whose intake was usually reported by the household respondent. The individual estimated the amount ingested and reported the name of the eating event (breakfast, lunch, dinner, supper, snack, etc.) The time the eating event began, with whom it was eaten (alone, other household member, nonhousehold member), and where it was eaten(someone else's home, restaurant, fast-food place, school, etc.). For food bought and eaten away from home, the kind of service (water/waitress, counter, cafeteria, vending machine, carryout) and amount paid were recorded. Each individual was asked about health status, height and weight, water consumption, and use of vitamin and mineral supplements.

The supplemental samples were the same as those described in the household component above, however, the elderly and the low-income II surveys included only a 1-day recall. In the Spring portion of the Basic survey and in all supplemental surveys, all members of sample households provided information. In the Summer, Fall, and Winter of the Basic survey, data was obtained for all household members under 19 years of age but for only half of household members 19 years of age and over.

PRODUCTS: Products include a series of reports and magnetic data tapes. The products listed below are available from the National Technical Information Service 1-800-553-6847 or 703-487-4650; please provide the accession number when ordering. A series of magnetic data tapes for both components and for the supplemental surveys are available from NTIS also.

HOUSEHOLD USE OF FOOD COMPONENT
